But as we can see on this list, there are also those people, including me, that have had good experiences with Chinese made goods as well. (I have been happy with my Kaito KA1101, and KA1102 radios. My Eton E100 was made in China. I am happy with it. And my Eton E5 radio was designed in California, but built in China. I am happy with it also.)
So I guess it all depends what factory your item was made in. Or perhaps what Chinese company made or assembled your item.
But, the Chinese must realize, that if they want to sell a lot of goods to us in the west, they will have to have high quality goods. That way they will better their chances of being successful in the market place. So, like a previous poster said, their quality will most likely improve as time goes on. The Chinese do not want to fail in the international market place.
CHINA - Some factorys make junk! Some factorys are starting to make some good stuff.

Best of the Christmas Season to all, -Cato

Yes, that's what I've heard. Russians on their forum (as much as I could understand) are talking about 2 versions of circuits in Degen 1103. But may be it was only change in external antenna commutation somewhere in 2004.

> > The most comprehensive description of the KA1103/DE1103 appears to be

Yes, thanks - and here is "normal" English translation, edited by some american user:
http://www.radioscanner.ru/receivers/review/degen1103_eng.html . IRIS has done a great job - very detailed review, not just a compilation. There are, as I understand, other his publications on modifications made by IRIS and other users (not by the factory) in Degen 1003, but this requires knowledge of Russian.

Dan Say, - thanks for the link to Ontario Dx website. Now that I knew where and when to look for, and got rid of AC adapter on SW - using batteries instead, as my friends suggested, and stepped out to the balcony - I think SW works fine for my particular location. Yesterday late evening Radio Australia was more-less where it should.

I really have a terrible apartment - it was miracle to get any reception at all in the room. The exterior walls, as it turned out, are covered with metal sheets (wet weather protection), and the window and balcony is facing North, towards Rocky Mountains some dozen miles away. And between those mountains and me there is an electrical Skytrain viaduct, railway terminal at Main Str (I'm at Main and 2nd), plus freight rail-yard, railway engine depot or some engine repair facilities few hundred meters away. Cars and trolley-buses are probably generating more noise than rail yard, though.

Btw, I was wrong about Kaito 1103 tuning to AM 1040 when dialing 140 - it is, as I understand, really 140, i.e. Long Wave channel of the same station.

The 735 is fine, very sensitive. I was mainly referring to some of the
2010's scanning and tuning niceties, going to specific sw bands with
the punch of a button -- the 735 is more of a "stick shift" type of
listening rig to me, fine for ham band use, but the 2010 gets me
around to sw stuff easier.

One reason I still have my 735 after all these years is I don't think
the new rigs would be appreciably more sensitive at picking out weak
or crowded signals... :-)

No there is no difference; they are both electromagnetic radiation but with differing wavelengths. They both move at the speed of light and they obey the same principles (Maxwell's equations). Radio waves are also 'photons' and have both wave and particle behavior.

BTW, as someone else posted Michaelson and Morley (in one of the most amazing leaps of knowlege ever taken by man) dispelled the ether myth at the end of the 19th century when they measued the speed of light exactly the same whether the observer was moving towar the source or away from it. This measurements would have been different if there was an 'ether' for the 'waves to move through'.

Hi Justin,

I am not familiar with your particular radio, so some of this is guess work.

Some radios do not cover all of the shortwave frequencies, which end at 30 MHz. My guess is that yours does not have coverage above 26.1 MHz. All you are missing really are the CB channels and one ham radio band.

Probably when you listen to the AM band, the kHz will display instead of MHz. When you listen to shortwave (SW) or FM, then MHz will display. Don't worry about this. By the way, 1000 kHz (kilohertz) is the same thing as 1.000 MHz (megahertz) Just math.

The display in your radio is probably a "generic" one that is used by the manufacturer for many different radios. Your particular one doesnt cover AIR, LW or MARINE - so you never see that "light up" in your display. Other radios may include these bands. Sounds like an all-purpose display and those things that are "activated/designed" into your radio will light up the appropriate segments of the display.

Nearly all radios with AM band coverage have a small loop antenna inside, known as a ferrite rod. WHen listening to AM, move your radio around until you get the best reception (you are aiming the little internal ferrite rod antenna). All of the other bands, use the whip antenna...so you don't need to rotate the radio on SW, FM. WX, TV.

AM: 10kHz
FM: 200KhZ
SW: 5kHz
TV: CH 1
WX: 25kHz

These numbers above are references to the tuning steps in your radio for each of the bands. So on AM, you tune in 10 kHz steps. Example, 600 kHz, 610 kHz and so on. Shortwave is increments of 5 kHz, which is fine for listening to international broadcast stations. TV, WX (weather) and FM have the normal tuning increments you would find standard.

As a starting point, listen to shortwave stations between 5.0 and 10.0 MHz. You will hear most of them in that range.

Welcome to shortwave radio. It's fun.

What you need to understand is how to provide a link from a website
that uses frames.

http://standeyo.com/NEWS/06_Sci_Tech/061220.cell.phone.outage.html

or the original source
http://redtape.msnbc.com/2006/12/why_cell_phone_.html

You need to open a frame in a new window to get the real address. Now I
understand why you keep putting that devilfinder.com in your posts. You
think you are providing a link, but really it is just the link to the
search engine.

Is this some problem due to webtv?

No, it's not the LW channel - there are no LW broadcasters in North America. Rather it is an unwanted effect of the superheterodyne receiver: a signal can be shifted into the intermediate frequency stage at more than one setting of the tuning control. The DE1103 uses a 2nd IF of 450kHz. When the radio is tuned to 1040 kHz, the local oscillator is effectively operating at 1490 kHz to produce a mixer difference of 450 kHz. However, a LO frequency of 590 kHz also will produce the IF - that corresponds to a tuning of 140 kHz, known as the image frequency of 1040 kHz. Better superhet radios have sufficient selectivity ahead of the mixer that the 1040 kHz energy and consequent image signal are very weak and almost undetectable.

Hiya... I have an R75 with all the Kiwa mods. Even without the Kiwa mods, the R75 is a decent radio for program listening. Don't let anyone tell you otherwise. The criticisms of the R75's audio are really overstated. I've found that the Kiwa audio mod helps out a bit, but it isn't a tremendous improvement. You'll no doubt get Drake fans spewing out all kinds garbage about the R75 "making a good door stop", but the absurd and inflammatory nature of their statements are their own indictment. They don't like the idea of a $500.00 dollar radio outperforming one that they paid $1,800.00 for. I've also used each and every one of the R8 series radios. They are not... I repeat... NOT as good for DX'ing as is the R75. That isn't brand loyalty, that is a fact. The R8's with their warm audio and ssb selectable sycn is absolutely superlative for program listening. BUT.... That doesn't mean that the R75 is a bad radio for program listening. It's adequate to good. And... Once again... You don't need the friggin mods. When I really want to dress up the audio from my R75, I run it through my PC's sound card. I have a five point surround sound speaker set up with a full software equalizer and effects package. If I use ssb ecss tuning to listen to a weak or messy broadcast signal with my R75 or with any other radio, I run it through my sound card and use my software mixer/effects to make it sound as full and robust as if it was is AM mode. I have a number of mixer/effects presets that I have set up just for that exact purpose. Not to mention, if you get a broadcast that is too muffled or too tinny or has too much mid range, all you have to do is more a few sliders on the mixer and viola... A comfortable broadcast to listen to. So... I can get my R75 to sound great for broadcast, but I cant get the R8 to perform for DX'ing like the R75.

Let me put in a bit of a plug for my site, URL in the signature.
There's Canadian data there too.

The *official* Canadian data is on
http://spectrum.ic.gc.ca/engineering/engdoc/baserad.zip .

Hi Justin:

- Welcome !

as well as purchasing a copy of Passport to World Band Radio, you might look around for copies of

Monitoring Times and Popular communications in Huge news stands near where you live.

You will eventually want to hook up some kind of external antenna; you can start with some insulated wire (15 - 30 feet) with a few turns wrapped around the antenna, and the rest of the antenna taped on a window (for starters)

Right now, solar conditions are kind of limiting propagation,

but theres still all sorts of stuff you can pick up out there

- So enjoy !

> try to enter in a number bigger than that I get an error.

Justin,

When you go to the web site you quoted above, carefully look in the lower right corner of the blue picture of the radio. You will see a button marked "Product Manual".

Clicking on this will give you a 32 page .pdf manual for the radio.

Look at the specifications on page 29 and you will see that they list the range of this radio on short wave as 2.3 to 26.1 MHz...so your radio is performing as it should.

Always remember that old adage:

"When all else fails, read the instructions!" :-)

Good luck and enjoy your new radio!

No. One might call the metric tensor of general relativity or the
Higgs field in quantum field theory as "ether". But this has nothing
to do with the ether of 19th century. 19th centurie's ether constituted

a preferred frame of reference. Relativity tells us, that such a
preferred
frame of reference does not exist. The metric tensor or the Higgs-field
do not prefer some frame of reference. Giving them different names
(like "ether") doesn't change anything in relativity.

Interesting chart.

It should be noted that is somewhat out of date.

NiMH AA capactiy is way more than 1200 maH now. I believe I have seen
them as high as 2800....perhaps they are even greater now. For some
applications, they rival alkaline.

I was going to add my two cents worth but the previous posts are so
complete there is nothing to add except do not be disappointed if you
do not seem to get many stations . The current barrage of matter from
the sun has temporarily affected the ionosphere and both short-wave and
am band reception is poor. Conditions will improve. Your new radio
looks very interesting. Let us know how you like it when you have tried
it out.

Because it sounds like a potentially interesting story. This is how people
grow - by learning constantly.

4743. Re: What the f*ck is Kwanzaa?

Newsgroup: rec.radio.shortwave
Date: 2006-12-21 16:08:50 UTC
From: Guerite <aim@their.head>
Message-ID: <12olcc0j7ojne2@corp.supernews.com>
Source record: 100832
Cross-posted to: rec.radio.amateur.policy,rec.radio.shortwave

Black civil rights activist Reverend Jesse Lee Peterson wrote, "...the whole holiday is made up! You won't find its roots in Africa or anywhere else."

Kwanzaa is not a traditional holiday of African people and is observed almost exclusively in the United States.

Ron Karenga created Kwanzaa in California in 1966, during his leadership of the black nationalist United Slaves Organization (also known as the "US Organization"), in order to give African Americans an alternative holiday to Christmas. He later stated, "...it was chosen to give a Black alternative to the existing holiday and give Blacks an opportunity to celebrate themselves and history, rather than simply imitate the practice of the dominant society."

In 1967, a year after Karenga proposed this new holiday, he publicly espoused the view that "Jesus was psychotic" and that Christianity was a white religion that blacks should shun.

Ron Karenga's criminal record includs having been convicted and jailed on charges of felonious assault and false imprisonment for the torture of two black women.

Tony Snow, White House Press Secretary since April 2006, wrote that "There is no part of Kwanzaa that is not fraudulent." and other writers have remarked on the Marxist leanings of Karenga and some of the seven principles of Kwanzaa, questioning whether Kwanzaa should be taught in American schools.

The seven principles of Kwanza correspond to Karenga's notion that "the seven-fold path of blackness is think black, talk black, act black, create black, buy black, vote black, and live black." - PURE racism!

http://en.wikipedia.org/wiki/Kwanzaa

The first and second priciples of Kwanza are racist:

"To strive for and maintain unity in the... race."

"To define ourselves, name ourselves, create for ourselves and speak for ourselves."

The third and fourth priciples are also racist and endorses Communism:

"To build and maintain our community together and make our brothers' and sisters' problems our problems and to solve them together."

"To build and maintain our own stores, shops and other businesses and to profit from them together."

The fifth priciple's goal is the same as todays Islam-0-facists:

"To make our collective vocation the building and developing of our community in order to restore our people to their traditional greatness."

The sixth priciple is the only legitimate priciple assuming it is not exclusionary and the words "our community" does not imply racism:

"To do always as much as we can, in the way we can, in order to leave our community more beautiful and beneficial than we inherited it."

Now knowing their agenda the term "our community" in the Kwanza priciples are exclusionary, racist and communist.

How many of you have young children in public shools being taught about communist Kwanza?

My impression, havng owned an R75 for quite awhile now, is that it is a splendid DX machine, capable of nabbing very weak signals quite audibly and easily, even with modest antennas. IME the Kiwa mods have helped quite a bit, provided a huge and welcome stabilizing factor (read "improvement") for the AGC (the most important improvement by far), and the sound quality is clearly better. People will say that the S-AM fix still doesn't get it fully recitifed, and that may be true, but I can tell you, selective fading distortion now is simply a nonissue - it has no relevant effect on reception after the modifications have been done. I have yet to get the HiFi roofing filter mod, partly because I am lazy and partly because I haven't found it necessary. The DSP and noise blanker and dual passband tuning features are also really helpful, and fun to use. I do run it through a small bookshelf speaker to provide clearer, warmer sound - but that's the only external audio thing I use (I use an MFJ-1026 for local noise reduction), and it only cost me $20.

People do all sorts of kooky things with radios, and I'll bet there are some who shunt their R8B audio through $50,000 audio systems, too. I think this has more to do with a desire to tinker than any grinding need to wrack the last bit of DX performance out of their equipment.

I will agree with anyone that Icom screwed up on the S-AM, and acted irresponsibly and falsely when it claimed it had a working version of this feature, and that is enough to make anyone sour on the brand when they have had good results with other manufacturers. Furthermore, I would love to have a Drake R7 or R8B to augment my equipment list. I can say the same about a dozen other pieces of equipment that have come and gone over the years. However, for me the R75 has proven to be an excellent radio, moreover an excellent *value*, and has provided me with many hours of high-quality radio listening, despite a second-rate listening environment and limited antenna space. I have clear station IDs from large and small stations around the globe, and that is not

wholly due to extraordinary skills on my part ;-)

Bruce Jensen

Who is Ron "Maulana" Karenga?

Socialist Activist and Black Nationalist

Founder of the militant black power organization United Slaves

In 1971 was arrested for assaulting and torturing two female members of his organization

Professor and chairman of the Department of Black Studies at California State University, Long Beach

Has spoken at the Socialist Scholars Conference

Creator of the African American holiday Kwanzaa

Ron Karenga is professor and chairman of the Department of Black Studies at California State University, Long Beach. An activist and Marxist, Karenga is best known for creating the African American holiday Kwanzaa. In the mid 1960s, he bestowed upon himself the title "Maulana," Swahili for "master teacher," and is now widely referred to simply as Maulana Karenga.

Professing a devotion to combating "systemic racism," Karenga began his foray into black nationalism in the early 1960s, founding the militant black power organization United Slaves (US). In his description of the goals of US, Karenga said: "From the beginning, the essential task of our organization US has been and remains to provide a philosophy, a set of principles and a program which inspire a personal and social practice that not only satisfies human need but transforms people in the process, making them self-conscious agents of their own life and liberation. Such a transformative practice will, of necessity, also lead to the building of moral community and to the constant becoming of the best of what it means to be both African and human in the fullest sense."

In the organization's quest to "satisfy human need" and build a "moral community," its members, including Karenga, have served prison time for various crimes including murder. In 1969, US was involved in a disagreement with the Black Panthers regarding two candidates who were vying for a directorial position at UCLA's newly created Afro-American Studies Center. US backed one contender, while the Black Panthers supported another. The dispute ended when two US members shot and killed two members of the Black Panthers, John Jerome Huggins and Alprentice "Bunchy" Carter. UCLA chancellor Charles E. Young later dismissed the killings as unrelated.

In 1971, Karenga and US members Louis Smith and Luz Maria Tamayo were convicted of felonious assault and false imprisonment for assaulting and torturing two female US members, Gail Davis and Deborah Jones. Following

this incident, and the incarceration of Karenga in a California State prison, US temporarily disbanded before being reestablished by Karenga in 1975.

Notwithstanding the track record of disputes between US and the Black Panthers, Karenga once spoke at an event that featured Black Panther co-founder Bobby Seale - the 17th annual Black Consciousness Conference in 1996. In a speech he delivered in 1968 prior to the Democratic National Convention in Chicago, Seale called for demonstrators to riot, stating: "If the police get in the way of our march, tangle with the blue-helmeted motherf---ers and kill them and send them to the morgue slab."

As previously noted, Karenga is commonly known as the originator of Kwanzaa, an African American and Pan-African holiday. In 1977, Karenga devised a cultural philosophy called Kawaida, a Swahili term for tradition and reason, from which the holiday Kwanzaa arose. Karenga billed Kwanzaa as an alternative to Christianity, Judaism, and Islamic traditions. He asked his followers to follow the seven "principles" of Kwanzaa, known as the "Nguzu Saba," or the "Seven Principles of Blackness," which are observed during the seven days of Kwanzaa. The principals are as follows:

1 Umoja (Unity) - To strive for and maintain unity in the family, community, nation and race.

2 Kujichagulia (Self-Determination) - To define ourselves, name ourselves, create for ourselves and speak for ourselves.

3 Ujima (Collective Work and Responsibility) - To build and maintain our community together and make our brother's and sister's problems our problems and to solve them together.

4 Ujamaa (Cooperative Economics) - To build and maintain our own stores, shops and other businesses and to profit from them together.

5 Nia (Purpose) - To make our collective vocation the building and development of our community in order to restore our people to their traditional greatness.

6 Kuumba (Creativity) - To do always as much as we can, in the way we can, in order to leave our community more beautiful and beneficial than we inherited it.

7 Imani (Faith) - To believe with all our heart in our people, our parents, our teachers, our leaders and the righteousness and victory of our struggle.

Upon examination, Karenga's "Seven Principals of Blackness" are nothing more than the Marxist precepts of parity and proletariat unity. In a 2002 article, Ann Coulter observed that the seven principles of Kwanzaa are also same seven principles of the 1970s domestic terrorist group - the Symbionese Liberation Army. Each snake head of the SLA's emblem stood for one of the SLA's revolutionary principles: Umoja, Kujichagulia, Ujima, Ujamaa, Nia, Kuumba and Imani - the same seven "principles" of Kwanzaa.

A self-proclaimed "African socialist," Karenga has said, "One of the most urgent challenge[s].of our time is the reconstruction of U.S. social policy. That's the question at hand, and its possibility for social infusion is a critical one for it has to do with shaping the vision and participating in the unfinished project of making the U.S. a just and good society in a multicultural and global context. What we have to do in this talking, this ethical vision, has first of all to be separated from the right-wing insistence on morality."

Further demonstrating his affinity for Marxism, in 1998, Karenga and United Slaves issued a statement in support of the Third Annual Celebration of Cuba's Internationalism. The statement read: "The Organization US joins all freedom-loving peoples around the world in standing in solidarity with the Cuban people in their heroic and historic struggle to defend their right of self-determination and to break out of the unjust and immoral economic boycott by the U.S. government."

In his own ruminations on why the 9/11 attacks occurred, Karenga points to his belief that capitalism is to blame. He writes: "Perhaps, then, it is not the material goods some of us have that they hate the U.S. for, but for attempts to impose the materialism of a consumerist society on them, to turn them into homogenized consumers of a McWorld system. And perhaps it is not that they are against freedom and justice and related values, but against the U.S.-imposed interpretation of this. Perhaps, they resent the arrogance of imposition and the inequities imposed by a globalism that grinds them underfoot and denies them a right of self-determination and security that we say are indispensable to us and our allies."

In addition, Karenga blames U.S foreign policy for the 9/11 attacks, stating: ".we might discover that from their [the hijackers'] perspective and those of people who will not commit such acts but are emphatic with their aims that they did it to: (1) avenge years of state terrorism, mass murder, selective assassination, collective punishment and other forms of oppression by the U.S. and its allies; (2) to demonstrate vulnerability of the U.S. at its crucial centers of power, i.e., financial - Manhattan, military - the Pentagon, and political - Washington, D.C.; (3) to cause the rulers of the country to fear, to be uncertain and to reverse the role of hunter and hunted; (4) to insist on being heard and considered in human, political and military terms; (5) to demonstrate a capacity to strike regardless of the superior strength and technology of the U.S.; and (6) to dramatize and underline in a highly visible way the asymmetry of suffering between the U.S. and the oppressed in the world."

Karenga has been an outspoken critic of the War on Terror and the War in Iraq. In an April 2003 event at CSULB, he joined faculty and students in a "Walk Out for Peace" anti-war rally organized by Students Against the War. Karenga invoked his African American philosophy of Kawaida, stating, "Our ethical tradition requires several conditions for a just war, which this self-declared war against the Iraqi people doesn't meet. This is not a war of self defense, it is a war of self aggrandizement." On another occasion Karenga wrote, "the proposed war against Iraq is not an isolated initiative. Rather, it is part of a post-9/11 imperial offensive which carries with it

racist and colonial conversations and commitments of 'crusades' to protect 'the civilized world' against 'dark and evil nations' in 'dark corners of the world.'"

Karenga holds two Ph.D.s - one in Political Science, with a focus on the theory and practice of nationalism (obtained from the United States International University), and one in Social Ethics, with a focus on the classical African ethics of ancient Egypt (obtained from the University of Southern California). He also holds an honorary Doctorate of Philosophy, which he received from the University of Durban-Westville, South Africa. In 1989, Karenga became head of the Department of Black Studies at California State University, Long Beach (CSULB). The Department, which seeks to "critically examine and understand the African experience from an Afrocentric perspective," features such courses as "Politics of Black Power" and "Racism in the American Military."

Karenga has been a featured speaker at the Socialist Scholars Conference, which is held each year by the City University of New York's chapter of the Democratic Socialists of America. The conference features the elite of socialist academia - scholars, union activists, political revolutionaries, reformers, and those who condemn "corporate greed." Past speakers and panel members have included Michael Moore, Al Sharpton, Noam Chomsky, Ron Dellums; Jerrold Nadler, and Major Owens.

Karenga's other achievements include serving as chair of the President's Task Force on Multicultural Education and Campus Diversity at CSULB; as the director of the Kawaida Institute of Pan-African Studies, Los Angeles; and as a member of the national organizing committee for the Million Man March/Day of Absence. In addition, he has sat on the executive committees of the National Black United Front; the National African American Leadership Summit; the Black Leadership Retreat; and the National Association of Kawaida Organizations. He is also the writer of such books as Introduction to Black Studies, purportedly the most widely used introductory text in Black Studies, and Kawaida: A Communitarian African Philosophy.

Karenga is the recipient of numerous awards, including the National Leadership Award for Outstanding Scholarly Achievements in Black Studies from the National Council for Black Studies, and the Pioneer Award from the Rainbow PUSH Coalition and Citizenship Education Fund.

How will knowledge of radio outages make you grow? Does your cellphone ever drop out of cells? How about your vehicle? How about your computer,does it ever crash and dive? My Velocity Micro ProMagix www.velocitymicro.com computer never does that.I am listening to a Dublin,Ireland radio station on it right now.

Glad to see you mention this, and I agree completely. This is perhaps
the most significant argument against the ether, although, as I
mentioned earlier, quanta don't behave quite the same as normal
Newtonian physical elements, and that through which they travel might
also be independent (and move independently) of the space-time to which
we are confined. M&M did not know about the true nature quantum fabric
at that time - and we still don't have the all the pieces of *that*
puzzle.

David wrote:

> Energy sets up a field around an antenna.

Yes, an EM field.

> It alternates at some rate[s] per second but there are no waves that I know of.

The fact that the field "alternates" or "vibrates" at some frequency, in either kHz or MHz or etc, and the fact that this vibration can be detected at distance (in another EM field through an LC circuit), is the evidence that the signal has properties of a wave. It also, like any other quantum entity, has properties of particles (photons). All of the concepts that we normally associate with physical and mechanical waves - travel (propagation), velocity, resonance, wavelength, frequency and interference patterns, are exhibited by radio signals. That is why we use the term "wave" to partially describe the phenomenon.

Another way to look at it is that the energy of the signal waxes and wanes, positive to negative, at the rate of the frequency of the signal. This is also a classic wave signature, and is readly seen in ocean waves or even ripples in snowdrifts and sand dunes.

You can go to Walgreens or RiteAid and similar stores in your city and buy cheapo radios just as good as on those online stores.I have many,many,many little old shirt pocket size radios,and larger size radios that I have bought over the years at places such as thrift stores and fleamarkets and junk shops.Some of them work ok,some of them don't work too good,some of them don't work at all,some of them are collectible radios.Although I never counted noses before,I am sure I own at least three hundred or more radios of various name brands and off the wall name brand radios of various shapes and sizes.I like to collect all kinds of old,old thingys

So what would you rather have people (of any color) do - Not help each other, not support each other, not work together for something mutually to their benefit? You think every single person should be an island, never once helping his/her fellow human lest they be considered a Socialist? Do you kick a guy when he's down because it is the patriotic American thing to do?

That is so unnatural it is absurd - to you, a regular old-fashioned village, in which everyone is a part of the greater community where everyone must live, must sound like Lenin is behind every door. I am concerned about the racist aspect of the ideas too, but jeez, come on - natural normal people help one another, look out for the other guy, and try to help humankind progress by working together. This is not Communism, it is the simple milk of human kindness.

I'd hate to live in your world.

I think you are right - a good sensitive receiver with good front end
and decent filters, of any age, is going to get you just about
everything you need. In that regard, some older receivers may put the
last 15 years' worth of models in the shade.

I have no problems tuning the Sony ICF-S10MK2, especially with the LED tuning-indicator, so you know when a station is right on. I have a problem, because I previously wasted money on my digital PLL radios, but found that anlog-tuning through the AM band much more enjoyable. I also have a problem with spending much more on radios that have virtually the same performance as the Sony - case-in-point, the now-returned piece-of-shit Grundig S350 got the same DX stations as my other digital PLL radios, which my car radio gets, and which the Sony gets.

Source record: 101007

The KGB's Useful Idiots

I was recently the subject of an interview on a revelation in my book on Ronald Reagan and the fall of Communism,

http://www.amazon.com/gp/product/product-description/0061136905/ref=dp_proddesc_0/102-0484093-6997752?ie=UTF8&n=283155&s=books

in which I feature a May 1983 KGB memo concerning an offer from Senator Ted Kennedy to Yuri Andropov. In response, I received several e-mails calling Kennedy a useful idiot - or worse.

In fact, there are numerous examples of leftists unwittingly serving the Soviet cause in the 1980s, which today sit in Communist government and media archives, some of which have been translated and are easily accessible in the United States. There they gather dust, as liberal historians and journalists ignore them, failing to do their jobs, never reporting the real history that exists.

I would like to here cite just two examples from 1983, one of the hottest years in the Cold War: Ronald Reagan's Strategic Defense Initiative (SDI) and his decision to invade Grenada.

SDI

On March 23, 1983, Reagan announced SDI. "My fellow Americans, tonight we're launching an effort which holds the promise of changing the course of human history," he declared in a nationally televised address. He announced his vision for a space-based missile-defense system-his "dream." "With every ounce of my being," he said later, "I pray the day will come when nuclear weapons no longer exist anywhere on Earth." Reagan hoped SDI might one day "render nuclear weapons obsolete." He also came to see it as an extraordinary weapon to help bankrupt the USSR.

Coming only two weeks after the Evil Empire speech and amid his push to place intermediate-range nuclear missiles in Western Europe, Reagan's remarks left Moscow shell-shocked. SDI terrified the Soviets. It became an obsession to Mikhail Gorbachev, who spent entire summit sessions doing nothing but hysterically protesting SDI, begging Reagan not to go forward.

Leftists, however, had other plans. They dubbed the initiative "Star Wars," a term popularized by Senator Ted Kennedy, who the morning after Reagan's speech assailed the president's "misleading Red-scare tactics and reckless Star Wars schemes."

Kennedy had started something. "Star Wars" became a vehicle to lampoon SDI. In the 1980s, the Left caricatured Reagan as a dawdling, nostalgic ex-actor

who lazily wasted his time watching movies, losing himself in a world of fantasy. Surely, suggested the ridiculers, the old fool must have gotten the idea for SDI from the movie "Star Wars," envisioning himself as a kind of presidential Luke Skywalker combating the forces of darkness. As an amazing New York Times news story put it a week after the speech, SDI was "Mr. Reagan's answer to the film 'Star Wars.'"

If Kennedy had hoped to discredit the concept, he was making strides. His "Star Wars" term became extremely damaging, especially once the partisan press ran with it.

The media embrace of the term was evident in an exchange between Reagan and White House correspondent Helen Thomas:

Thomas: Mr. President, if you are flexible, are you willing to trade off research on "Star Wars".or are you against any negotiations on "Star Wars"?

Reagan: Well, let me say, what has been called "Star Wars"-and, Helen, I wish whoever coined that expression would take it back again-

Thomas: Well, Strategic Defense-

Reagan: -because it gives a false impression of what it is we're talking about.

Immediately after Reagan's plea, Thomas continued: "May I ask you, then, if 'Star Wars'-even if you don't like the term, it's quite popular.."

The term was popular because reporters used it. Reagan's request was reasonable: the program's name was the Strategic Defense Initiative. Objective reporters ought to be expected to use its proper name, not the name of derision invented by partisan detractors.

Reagan rightly feared that "Star Wars" suggested that he desired not a defensive system but an offensive war in space. It conjured "an image of destruction," he said, when, in fact, "I'm talking about a weapon, non-nuclear.[that] only destroys other weapons, doesn't kill people." Always kinder than his critics, Reagan charitably allowed that the media probably did not envision such a deleterious effect, instead using "Star Wars" merely "to denigrate the whole idea." Privately, he told one friend that he "bristle[d]" each time the media used the label and complained to two others that the term was "never mine" but the media's, "and now they saddle me with it."

They sure did. In Moscow, the Communist media loved Kennedy's term. To say that the Soviets likewise embraced "Star Wars" is inadequate; they used the label in every story on SDI. In fact, Soviet reporters rarely used the words Strategic Defense Initiative or the acronym, as they possessed more sinister motives: Significantly, whereas American journalists typed "Star Wars" in upper case to ridicule the idea as movie fiction, the Communists placed it in lower case to suggest SDI sought war amid the stars-"preparations for 'star wars,'" as the Moscow International Service, Pravda, Izvestia, and all other Soviet media put it. The Kremlin seized the term to further portray

Reagan as a nuclear warmonger-an image that another set of dupes in the West, the nuclear freeze movement, reinforced.

When Reagan tried to clarify his intentions and defend himself, the Soviets corrected him by citing American leftists. For instance, speaking on the vile "Studio 9," the leading news program in the USSR, propagandist Valentin Zorin, the KGB's Vitaly Kobysh, and academic Yevgeny Velikhov hammered Reagan's alleged "plans" "to fill the space around the entire planet with battle stations." "Only in his speech of 23 March 1983 did he formulate his idea, which became known as 'star wars,'" explained Kobysh to the captive audience. This name, said Kobysh, was "very irritating" because of what it (allegedly) advocated. One group not fooled by Reagan, however, were left-wing Democrats at home: "U.S. politicians," said Kobysh, "call it [SDI] the greatest deception of our time."

The Moscow Domestic Service was particularly grateful to politicians like Senator Kennedy and the American media for "properly" labeling SDI:

They christened it ["star wars"] with full justification, since this initiative envisages deploying strike weapons systems in space aimed at targets not only in earth orbit, but also on the ground. All the while, the White House has convinced itself that they have been misunderstood, that they have goodwill toward all mankind.[The White House believes that] certain forces, it seems, have distorted the essence of the Strategic Defense Initiative by labeling it the "star wars" program.However, Washington is resorting to mediocre verbal balancing acts in vain. There is nothing defensive about it.

Reagan was left alone to deal with the consequences of how SDI was mislabeled and misreported. In one interview with hostile Soviet reporters, he protested: "We're not talking about star wars at all! We're talking about seeing if there isn't a defensive weapon that does not kill people." The Soviet reporters were incredulous; after all, they had gotten the term from Reagan's own media, which, the Soviets naturally surmised, was certainly more objective on the matter than Reagan.

SDI was just one example of leftists unknowingly pumping the Bolshevik propaganda machine. Another case in point came a few months later, in October.

Grenada

On October 19, 1983, a Marxist group inside Grenada murdered Prime Minister Maurice Bishop. A violent military council trained by Cuba put itself in charge, jailed and killed Bishop supporters, enacted martial law, and imposed a shoot-on-sight, 24-hour curfew. These edicts threatened not only citizens but also the roughly 1,000 Americans present, most of which were students at the St. George's School of Medicine.

Reagan decided that this Communist advance would not be tolerated in the Western Hemisphere on his watch. Prior to Reagan, from 1974-79, under Presidents Gerald Ford and Jimmy Carter, the Soviets acquired 11 satellite or proxy states around the world. Reagan was committed to not "ceding one

inch" of ground to Moscow.

On October 25, 1983, 5,000 U.S. troops charged the shores of Grenada in the largest U.S. military operation since Vietnam. There were remarkably few casualties, particularly when measured against what Americans had been tragically accustomed to only eight years earlier. Only 19 soldiers died. By comparison, the United States lost 58,000 dead to the Vietnam experience. The commander of the task force in Grenada, Vice Admiral Joseph Metcalf III, boasted: "We blew them away."

U.S. troops found an enormous cache of weapons, armored vehicles, and military patrol boats, and engaged 800 Cuban soldiers. Only 30 hours after the start of the "rescue mission" (as Reagan called it), the first evacuated medical student to debark the airplane dropped to his knees and kissed the tarmac as he touched the soil of Charleston, South Carolina. The student's gesture brought a lump to the throat and tear to the eye of many Americans, including President Reagan. It was the sort of smiling military triumph that had become unfamiliar to Americans of the Desert One generation.

While Americans supported the attack, it was quickly denounced by the international community - even by Reagan's pal, Margaret Thatcher. The vote at the UN Security Council was 11-to-1 against the United States, while the General Assembly vote was a staggering 108 to 9, with America joined only by El Salvador, Israel, and (tellingly) the six Caribbean neighbors that requested U.S. assistance in the first place.

Still, Reagan succeeded in Grenada, a reality that nauseated the USSR. The Kremlin knew that Reagan's run for a second presidential term was only a year away. Moscow hoped upon hope that Reagan would lose. To the Soviets, the win in Grenada was bad news, not only because it stemmed Communism's advance, but because it boosted Reagan politically.

The Soviets searched for an angle to criticize the operation. The American Left provided one: Future Clinton administration Secretary of State Madeleine Albright dismissively likened the operation to a football game pitting an NFL team against "The Little Sisters of the Poor." Her words were mimicked by a future Democratic presidential candidate from Massachusetts named John F. Kerry, who said the invasion was like "Boston College playing football against the Sisters of the Mercy." Senator Kerry called Grenada "a bully's show of force." The sarcasm of Kerry and Albright was mild compared to Democratic Party voices like former Vice President Walter Mondale, Jesse Jackson, Senator Pat Leahy, and the editorial pages of The New York Times.

This form of criticism was as disturbing as it was baffling: The Grenada operation was not simple, as is true for any military operation-a fact painfully obvious to those of the Vietnam generation, like Madeleine Albright and John Kerry. Recent U.S. interventions had become easy fiascoes. Would critics have preferred that Grenada not have seemed easy?

No matter, liberals had their spin, and so did Moscow: This line became a talking point for the Communists. TASS, the official Soviet news agency, decried how "the master of the White House" had "strived to convince his

compatriots that they 'can be proud' of that operation." What was there to be proud of? America, exclaimed TASS, had flung a "mighty naval armada" and thousands of Marines at a "tiny island state" that did nothing wrong.

Like the American Left, a popular tactic on the Soviet side was to downplay the U.S. action as a petty operation by a bully, directed at a tiny, and thereby unimportant, country-a line that contradicted Moscow's obsessive attention. To buttress this viewpoint, the Soviets again borrowed from American leftists. To cite just one example, TASS devoted an entire statement to an article by Washington Post associate editor Robert Kaiser, titled, "Is This a Foreign Policy or a Recipe for Disaster?" Kaiser's 3,000-word op-ed in the Sunday "Outlook" section excoriated Reagan policy: "History?" Kaiser begged. "It has no apparent place in Ronald Reagan's view of the world, except for the caricatured version he has carried around in his head for years."

The Soviets adored the piece. TASS seized it, quoting it liberally and circulating it around the Communist world, effectively turning the article into a Communist press release.

Nonetheless, the Soviets were frustrated to find that most Americans supported the operation. The odious Valentin Zorin, who, echoing the New York Times's Anthony Lewis, judged Reagan a "blockhead" who "does not care to think," deduced that Americans were "the most misinformed people on earth." He reluctantly conceded that "a considerable number of Americans applauded Reagan" for his actions in Grenada.

Try as they might, the Soviets could not curb the operation's boost to U.S. morale.

Perhaps left-wingers ignore this information today because doing so enables them to recast history in their own image, to draw up their favorite politicians as onetime Cold Warriors who helped defeat the Soviet empire. Indeed, on Grenada, as the Boston Globe noted during the 2004 election campaign, John Kerry has today changed his tune: "Campaigning now for president," reported the Globe. "Kerry is rewriting that history.Kerry often lists Grenada among the U.S. military incursions he says he has supported." Kerry now says of the invasion, with a straight face: "I never publicly opposed it."

This laughable revisionism seems contagious among Massachusetts senators in particular: In response to the report in my book on the KGB memo, Ted Kennedy's office maintains, "Senator Kennedy was a strong opponent of Star Wars, but had a constructive relationship with President Reagan on the Soviet Union." Not exactly. (As their response demonstrates, even now, Kennedy and his staff still use the term "Star Wars," na&#65533;ve to the damage it once caused.)

Today, leftists try to claim that they, too, were Cold Warriors. That, however, is a fictional rewriting of history - which, of course, would not be the first time.

With the leadership, ingenuity, and courage of the Reagan administration, we managed to win the Cold War in the 1980s, and did so in spite of the American Left.

http://www.frontpagemag.com/Articles/ReadArticle.asp?ID=26004

Two days after comparing former Defense Secretary Donald Rumsfeld to Adolf Hitler, and nearly a week after suggesting a Republican conspiracy caused Democratic Sen. Tim Johnson to need emergency brain surgery, talk-show gabber Joy Behar got the chance to go toe-to-toe Wednesday with a Democrat: leading presidential hopeful Sen. Hillary Rodham Clinton.

In the end, they played softball, and they both made errors.

During a discussion on "The View" about the Iraq war and President Bush's announcement earlier in the day that he wanted to increase the overall size of the U.S. military, Clinton said she hoped the administration "will follow the lead of what the Democrats have been saying for, you know, more than a year... we have to begin bringing our troops home."

"But that's not what he's saying now," Behar chimed in. "He's saying increase the troops."

"That's right," Clinton said.

"He's saying more troops," added guest co-host Crystal McCrary Anthony.

"Right," said Clinton, adding, "If it's not going to change the mission, if it's not going to be a different strategy, I don't see where putting more troops [in Iraq] will make a difference."

Nobody on the show, including Clinton, noted that Bush had already addressed the issue during a nationally televised press conference.

So, this has - *what* - to do with Communism?

> What part of RACISM to you not understand?

My opposing comment was about your overt reference to communism applying to simply wanting to help a fellow human being. It had nothing to do with race - that was in your equation, not mine. I understood your comments perfectly, and recognized that, like so many others trying to force a point over which they have no control, you are willing to mix apples and oranges. You are seriously confused, and are grasping at straws.

So, assuming you are right, what do you propose to do about it? Kill or jail all the black people who do not vow to include whites and latinos and asians in their somewhat limited philosophy? Put them on locked reservations? There isn't a lot else you can do without reaching out to them with another idea - and you just don't seem the type to reach out to anybody. Unless you have a solution to the problem, quit your pathetic self-pity and whining.

And by the way, I stand by my comments. The words, as written, simply are principles that communities have lived by for millions of years. It is the natural companion to the Biblical phrase "Love thy neighbor as thyself." Yes, racism is a problem in this philosophy as elsewhere, but finding Communism in those words is just ridiculous. I'd hate to live in a world as selfish and heartless as yours.

HJi. My 7600GR has arrived at home and is still in the box. I'm concerned that its features will be difficult to use and learn effectively. I have never had a shortwave radio before and have never used a synch detector nor an attenuator. Are there full instructions about these features in the owner's manual? I just want to get as many stations as possible, using the best tuning methods.

There may be a few more controls, but it's not really different
from the average AM/FM radio. Treat it like that to start, and then
when you get used to it, start kicking in the extra features.

I suspect the big difference will be the RF gain control (if it
has one, I don't know, and it may be labelled somewhat differently).
You don't find those on the average AM/FM radio. But, they will
generally only kick in if you turn off the AGC (ie automatic
gain control). Then, you will be able to attenuate strong signals.
The real reason for bringing it up is not because you'll need
to fuss with it at the beginning, but if the AGC inadvertently gets
turned off and the RF gain control is somehow set low, you might
suddenly puzzle over the insensitivity of the radio.

The synchronous detector, you don't need to start with. Get a feel
for tuning stations to begin with, and then try it later. It may require
no real skill to use, I suspect it depends on the specific implementation
in a given radio.

You might even just start with the AM broadcast band, since those
are signals you are used to, and play with the controls. Try to find
a weaker signal adjacent to a strong local station, and see how the
various controls can be manipulated to try to improve the reception
of the weaker signal.

The real trick to shortwave is really, apart from maybe more fading
of the signals, is that shortwave broadcast stations don't use the
same frequency all the time, and radio conditions will affect reception.

So when you find Radio Australia, for example, it won't necessarily be
there later that day. And even if it did, you might not be able to
receive it because of band conditions. Higher frequencies for daytime,
lower frequencies for nighttime.

Source record: 101023

hi,

here's my question - i have 4 radios that i'm testing side by side. a palstar r30cc, kenwood r-1000, kenwood r-5000 and an icom r71a. i have a 100ft. endfed longwire antenna strung up between two trees. when i hook the antenna up to the palstar and r-1000 i get excellent reception below 540 khz. the palstar's tops, but the r-1000 holds its own and picks up most beacons that i have logged. when i hook the r-5000 and the icom r71a i get nothing but noise below 540khz. i can hear some beacons but they are faint and in the backround with lots of noise on top. shouldn't it be the other way around? these sets in their day cost in excess of 1000.00. is the palstar that much better or is my antenna wrong for these radios. i have the antennas hooked to the longwire high Z inputs on all the radios - would the r-5000 and r71a perform better with a coax fed into the 75 ohm input - such as a dipole. why are the less complex radios kicking butt? is it possible that the internal noise generated by the icom and kenwood is causing the problems. i'll admit that my antenna is pretty simple, but i logged many low power beacons from western canada with it and the palstar.

You will have no trouble. Learning curve is pretty easy.

You will rarely use the attenuator.

For synch detect. Simply switch it in when listening to a station in
AM mode. If it helps leave it in, if not switch it out.

The manual will guide you. If you have further questions, post them.

You have a very nice portable radio. Congrats

I am not sure that should respond to something like this at all, but
just for the sake of fairness - 7600GR doesn't appear to be superior.
Reception and sound are not better than in De/Ka 1103, display is not
too good either, no battery charger (I hope there is no need to explain
about AC adaptor and SW), and also a bit larger and heavier than 1103
(this is important in my outdoor uses). Somehow Sony have managed to
come up with item inferior to 1103, - which is confirmed by slightly
lower ratings in all the rviews that I've seen. 7600GR is no longer
manufactured, if I'm correct, - and there is nothing newer or better
from Sony to replace it.

Anyway, I am looking at the box now, still sealed. The radio is
shockingly smaller than I expected. I thought it was going to be the
size of an average Bible, instead, it's as big as a standard envelope.

The size doesn't matter, as long as, the audio is good - Sony, as
usual, packed a lot of excellent electronics into a small package; just
be greatful, you didn't get a Grundig/Tecsun/Eton S350, or similar type
receiver...

Those waves manifest on a boundary between 2 different media as would
be expected by changing density below.

Would waves exist without the passage of time? Would the field still
be there?

4790. Is "Guerite" actally Paul Kengor, phd?

Newsgroup: rec.radio.shortwave

Source record: 101029

The postings from "Guerite" are so unrelated to rec.radio.shortwave
that I got suspicious and did a little checking around. Gurite claimed
in a recent post that he was a well-known anti-Communist author and a
professor at Grove City College in Pennsylvania. I wondered why a busy
professor and author would be Posting to this web site and wondered if
it was a student playing games. I found Dr. Kengor's home website and
mailed an enquiry to him to verify his postings.
Until I hear back from him (holidays delay answer) I recommend that
no one respond to his posts in case of computer scam (trojans, etc)

If it is within 1 wavelength of the antenna it is a local induction
field. If the antenna is efficient and actually radiates then beyond 1
wavelength it is an EM wave carried by photons.

A net aquaintance asked me what he needs for test gear to dial in a boatanchor. He told me he had a signal generator, vtvm, and a toob tester. I thought a scope might be a good addition to his bench and recommend a used BK. They seem to be a good buy and plenty guys have them and service info I think is easy to get. I have Tek 465 but I don;t think that is a good scope for basic bench. Too complicated and prone to fail and so forth.

I would like to hear comments on my recomendation for scope and also if there is some other piece of gear he should have.

I am always a little bit wary of reviews. Do you own both radios so
that the comparison that you are makeing is from your own experience or
from reading reviews that others have written?

I am curious as to your outdoor use. Do you walk around with the
radio? I like Degen for walking around because it is compact.

>From what I hear the 7600GR sync detector actually works well. If this
is true then this may *in some cases* shoot down your argument that
radio is inferior. I think it might be better to just say that they
are different. I am listening to an AM broadcast now and it doesn't
sound very good on my Racal RA-17 or on my ICOM R75. The distortion is
actually quite annoying at times. Maybe it would sound better on a
7600GR with the sync detector. Would I then have to say the 7600GR was
a better radio than either of the above? Probably not, just different
and maybe better at certain things. I have the Degen and am hoping
that my clan might gift me the Sony ICF SW7600GR for Christmas. I will
probably buy the Red Sun RP2100 in a few days as well - I will use the
excuse that I need to have a radio with IF out in order to purchase. I
am sure that I will find one radio to be better than another at one
thing and so on.

We are fortunate to live in the times we do - electronics are
reasonably priced and most of us can probably afford to have more than
one radio, so we have a choice. Color TV cost near 500 dollars in
1965. For most in those times that was better than 2 weeks worth of
pay. Today we can find a nice color TV set for 100 dollars. That is
maybe a day or so worth of wages for most.

I have owned both the ICOM R75 & R8B *Note this is B revision and not what OP asked for.

I had to sell the Drake R8B in order to pay for a thumb reconnecting operation. I wouldn't have gotten near enough money I needed for a thumb reconnection by selling the ICOM. So you see when you get yourself into a real big jam and need cash then it is better to have the Drake R8B than the ICOM.

The Drake R8B is a serious radio out of the box. The Icom R75 (I am told) has some potential, but to tell the truth it really isn't so good of a radio. It sounds very bad on AM. I send audio from headphone jack into a pair of amplified pc speakers, but even with the wide filter it is still muddy. Crappy audio. I don't have the same setup that Michael has and sounds like his setup sounds good. I wonder where he picks off the audio. The Drake sounded really nice. It has a good sync detector and very nice filter selection. The real reason I sold the Drake was because I knew I would replace it with another serious radio. A newer Racal, or a Harris 590A, or maybe I think it is a Ten-Tec RX340 that that fella Phil likes so much. Probably the Harris. I couldn't justify having two very expensive radios in the shack so the R75 is just here as a backup radio until I get cash flow to buy another real radio.

It never ever ends. You do not need to talk about mixer designs to
describe modulation. It is handy since most people that studies

communications can look at a signal flow graph and visualize the modulation. However, you can explain double side band simply from trig identities. In communications, you do the theory, then build the hardware. Those who do it backwards eventually get screwed.

cos(a)*cos(b)=0.5*(cos(a-b) +cos(a+b))

Make cos(a) here is the message, while cos(b) is the carrier. In this case you get two tones, i.e. the sum and difference frequencies that are located above and below the carrier. Why, it's like, dare I say, double sideband! Hence DSB is all you need. There is no carrier to suppress.

> rail yard, though.

The metal isn't that think and you can 'induce'
an antenna on your side with a sheet of aluminum
foil on the wall and a thin wire off it.
Same with foil on the windows or that sticky tape
foil window alarm.
The metal was another of the infamous Brad Holmes
"artist lofts" idea of selling under-furnished
apartments for too much money too little fitting,
but creating instant 'street-cred' with industrial
sheet metal cladding.

See the book lists in the back of the ODXA "Listening
in" sample issue and think about ordering some.

Go to both Com-west on 8171 South Main and also
Burnaby Radio (4257 East Hastings) and brows their
shelves on antenna books. As a receiver only you
don't need thick wire antennas.

See from the ODXA.on.ca book lists what your public
library has of of the same titles.
Burnaby Public used to have a lot of
'ham' and radio books pushed by local entusiasts.
You have equal borrowing privileges with them.
www.bpl.burnaby.bc.ca/
www.vpl.vancouver.bc.ca/

Those are NOT the Rocky mountains which are 400 kilometres
to the east, but the start of the Coast Range of mountains,
what the Americans call the Cascades.
http://www.bivouac.com/default.asp
http://en.wikipedia.org/wiki/Category:Mountain_ranges_of_British_Columbia

Mountains don't affect you in the middle of of the Fraser
Valley as you are too far away (8 km from a 1000 metre
"mountain" and most signals won't come that nothern way (and
1000/8000= is a pretty low mountain unlike Mayo in the
Yukon where you don't see the sun), for a signal from the sky
to be blocked by them. Besides if you have your azimuth
map you can see that sometimes you'll get long path radio
from around the world.

If you are are at Main and 2nd then you have welding and
light machine shops causing arcing as do the trolley buses
on wet days. How is it on dry days if you have them, and
what about after 6 when many businesses close down?
Check the signals when you come home from late-night xmas
partying at 4 in the morning. (Europe is having lunch
and sending signals to the rising East Coast), but signals
don't stop there but arrive after a few attenuating
skips to Second and Main.

Make a long wire with such things as a PVC pipe or hockey stick
Example :
http://www.hard-core-dx.com/nordicdx/antenna/special/broom3.html
http://www.hard-core-dx.com/nordicdx/antenna/special/northant.html
It's not easy to get long continuous wire in town. See what
R P Electronic Components Ltd. 2060 Rosser Ave Burnaby has.
They have a web site.

Learn about loop antennas and their breadth and directionality.
And loops don't have to "round" but more like a spider web
of spiral wire
http://www.hard-core-dx.com/nordicdx/antenna/loop/inducloop.html
http://www.hard-core-dx.com/nordicdx/antenna/special/reducin1.html

The word "hidden" antenna often means for apartments, e.g.
http://www.hard-core-dx.com/nordicdx/antenna/hidden/index.html
but have you gotten permission to go on the roof and thead
a long wire across its expanse, with a small feed line down?
2 two by fours each stuck in one of those decorative cement
breeze blocks for stability and some scarecrow flashes hanging
from the wire to keep humans from tripping into it.

What area of the balcony can see the southern sky? What
neighbour wouldn't mind a stick on one corner of their
south-facing (east- or west-) balcony out-of-the-way and a wire
to your balcony? And think in three dimensions: a neighbour
above, below, to the east to the west.

However since you say that you got a good signal from
RAustralia, the problem of only being able to see north
is moot.

Here's a thought about noise sources
http://www.hard-core-dx.com/nordicdx/antenna/lab/noise_pol.html

>
> Btw, I was wrong about Kaito 1103 tuning to AM 1040 when dialing

Well, I've been using the 7600 GR for a couple hours now. In fact,
I've gotten 3 hours sleep because I've been up, learning it. I have
never had a radio with direct entry before. I have several pages set up
with different memories: FM music, FM information, and AM talk, news
and information. This is a very sophisticated unit, with a lot of
features, but well thought out and easy to use.

4808. (OT) : Kwanzaa + Swahili + The Arab {Islamic} Slave Traders

Newsgroup: rec.radio.shortwave
Date: 2006-12-22 11:15:34 UTC
From: RHF <rhf-newsgroups@pacbell.net>
Message-ID: <1166786134.311507.99070@h40g2000cwb.googlegroups.com>
Source record: 100948

The name Kwanzaa derives from the Swahili phrase "matunda ya kwanza",
meaning "first fruits". The choice of Swahili, an East African
language, reflects its status as a symbol of Pan-Africanism, especially
in the 1960s, though most African-Americans have West African ancestry.
- - - http://en.wikipedia.org/wiki/Kwanzaa

The Swahili Language
http://en.wikipedia.org/wiki/Swahili_language
It is the Sub-Saharan African language with the most speakers and has
become a 'lingua franca' for East Africa and surrounding areas.

Lingua Franca
http://en.wikipedia.org/wiki/Lingua_franca
Arabic influenced African sub-Saharan languages, east African
languages, such as Swahili. Swahili was used along Trading and Slave
Routes.

IIRC - Long before the Europeans arrived on the West African side of
the African Continent : The Arab {Islamic} Slave Traders had been doing
'thier business' for centuries. The primary language of the Arab
{Islamic} Slave Traders for doing of 'their business' throughout Africa
was Swahili and in-fact the Lingua Franca of the Arab {Islamic} Slave
Traders was Swahili. Please Note - That the Arab {Islamic} Slave
Traders are still doing 'their business' in Africa to this very day.

SO WHY WOULD ANY AFRICAN-AMERICAN DESCENDANT
OF A SLAVE WANT TO USE THE SWAHILI LANGUAGE AS
A MEANS OF GLORIFYING PAN-AFRICAN-AMERICANISM ?

it boggles the mind ~ RHF

JOHN,

1 - Try a simple C-L-C "Matcher" between the Antenna
feed-in-line and the Antenna Input of your Receivers.

2 - Ensure that the Matcher is very well Grounded.

-or- # 3 - Place a Magnetic Long Wire Balun (MLB) -type-
Matching Transformer {actually an UnUn} at the point the
Long Wire Antenna Element meets the House and use a
50 Ohm Coax Cable from the MLB down to your Receivers.
Ensure that the Coax Cable is very well Grounded at the
Receivers.

hope this helps - iane ~ RHF

Source record: 100950

I've had my Antenna Supermarket Eavesdropper Dipole up for about 4 years
now.
Lately, it seems that reception isn't what it used to be.
Could it be the antenna and coax?
Or is it more likely that reception conditions are lousy?
If you think it is the antenna, could you please suggest a replacement
antenna and high grade coax system for me?
Please keep it simple, I really don't want to get into all the theory and I
don't have a lot of time to research and construct an antenna.
Thanks all.
Lenny

Lenny,

Unless there is some physical damage to the Antenna
and/or the Coax Cable they both should be fairly good
after four years.

1 - Take the Antenna and Coax Cable down
- Inspect the Antenna for Damage
- Inspect the Coax Cable for Damage

2 - Dis-assemble the Coax Cable Connections
- Clean them
- Re-connect them
- Seal them

3 - Check your Insulators and Feed-Point Mount
- Clean them thoroughly
- Repace if needed

hope this helps - iane ~ RHF

Huh?

The 465 is a nice dual-trace 100 MHz scope.

"prone to fail"??? The Tek build quality is superb and it would seem
much less likely to fail than a Heath or an Eico.

"Too complicated"??? Why? Just cuz it has dual trace and delayed sweep?
Those are -good- features to have in a scope.

OTOH, maybe a very inexpensive 10 or 20 MHz Heath scope would be a good
starting point for your friend. They can be had for virtual give-away
prices and he can always get something better later on.

Lenny,

If your Antenna Supermarket Eavesdropper Dipole Antenna
http://www.universal-radio.com/catalog/sw_ant/0680.html
is also using a Zap Trapper (or other device) in-line with the
Coax Cable then also check it out too.

Antenna Super Market Zap Trapper
http://www.universal-radio.com/catalog/protect/2993.html

Many Shortwave Listeners (SWLs) prefer the Alpha Delta
ATT3G50 type of Lightening {Static Discharge} Protection
becauseof the replaceable Gas Tube ARC-PLUG Module.
http://www.universal-radio.com/catalog/protect/4003.html

hope this helps - iane ~ RHF

Hey, thanks for the quick response RHF.
I'm also thinking about putting up a random wire antenna.
Exactly how do you attach the wire to the coax feed?
And is there a best antenna wire to use?
Finally, could somebody point me to a simple primer for antenna building?
Thanks again.
Lenny

Conditions have been pretty bad lately. I wouldn't be so worried about your antenna. (and as RHF says, most antenna damage is visibly apparent, it will be obvious to a good inspection)

With a random wire, just connect the wire to the center conductor of the coax feed. If possible, connect the shield of the coax to a good earth ground. A 9:1 balun can be helpful but not obligatory. Experiment: as long as the antenna is a safe distance from power lines, nothing you try can cause any damage.

The "best" antenna wire to use is whatever will stay up<grin>. Seriously, due to "skin effect" any wire that's physically strong enough to use will be big enough to work electrically. Just use whatever's cheap, convenient, and safely able to hold its own weight. Insulated or not, doesn't matter.

Source record: 100963

I have a like new in box Sony ICF-SW100S and a Sony AN-LP1 amplified preselector dipole antenna for sale. For the serious listener that enjoys not only standard broadcast shortwave but all the other broadcasts (military, hams, ship to shore etc,) this unit has a superb USB and LSB synchronous detection circuitry as well. Small, diminutive, but with either headphones or earbuds a powerful tool. The AN-LP1 is great for ferreting out those tough signals, and the rejection of the USB and LSB synchronous detector is great for stability. I didn't even crack open the documentation (manuals) so this is all in perfect new condition. Will ship to the continental U.S. only. If interested email me at dcisive@hotmail.com and leave a contact phone number where I can call to make arrangements.

Sony ICF-SW100S and Sony AN-LP1 shipped: $300.00

p.s. Last I checked radio alone was going for $399 over at Amazon.com The AN-LP1 is typically $80

You will need an antenna tuner AKA transmatch or a balun.

> And is there a best antenna wire to use?

What matters is the length and construction used to make the wire. You
can use insulated wire to help hide the wire from neighbors if you need
to. You do want to use solid wire since the signals are collected on the
surface of the wire for the best results.

HTH,

Keith

Very interesting reading. Regarding the translation, though, when some co-workers helped me translate another Chinese MIL radio manual, some of the phraseology came out just like the referenced post did. Literal translations for other than direct technical date are rough to work with. And... if you think the manual, per se, was tough to decipher and/or humorous, you should have read the translation of Chairman Mao's preface memo in my manual!!! Now there was a memo!!! HI!!

Very amusing translation and also the pictures, especially the tuning dials. The tuning gear, general layout and screening seem authentic (ie as the RCA model), but the valves (tubes) seem not to be. There are screened miniature valves in the RF section and (octal) glass valves elsewhere. The original; and as far as I know, metal octal except for the rectifier and voltage regulator glass octal.

HAM isn't as popular as it used to be. All of the old HAMS have either died off or are no longer on the air for various reasons. When a service is threatened due to lack of interest, something must be done to encourage people into the hobby. The FCC decided to eliminate one of the hardest parts of obtaining a ticket in an effort to encourage people to obtain a license and hopefully keep HAM radio alive and well. Why is it I do not hear much code on the bands anymore? It used to be that every ship at sea would communicate via key. Not today. Not in the age of Satellites. So, why would you feel the code should still remain an active part of being a HAM? Do YOU still use code? If so, for what?

Yeah, keep HAM back into the old days and don't evolve with technology. That's the way to do it. It was better in the old days when you had to bust your ass to learn a code that you would probably never use or even listen to.

Time to move forward. With the cost of equipment far more expensive than what CB used to be in the 70's, I seriously doubt HAM will turn into what CB has become. Also, you fail to mention the fact that the FCC DOES monitor and enforce HAM radio unlike CB that's become a zoo.

Anyone can go to the FCC enforcement website and read the many reports of hefty fines imposed on commercial radio and HAM alike.

And before HAM turns into a CB zoo, it would have evolved a lot further than it is today and people still wouldn't be able to buy a HAM toy to use like CB. Enforcement will become a HAM wide effort, whereas, established HAMs will have to keep an eye on new operators to ensure they don't cross the line and if they do, turn them in to the FCC for action. Most HAMS I know can work together to locate the fixed transmission of another HAM.

So, relax. You will probably be gone to the big HAM shack in the sky before HAM goes the way of CB.

Thanks Dan Say, - will try those ideas with antennas.
Yes, on dry and cold evening it was MUCH better.

No, I don't have 7600GR, and have to rely on reviews. The one by IRIS doesn't look impartial or incompetent, and he didn't note anything better done in 7600 than in 1103. The 1103 model that he tested, was better than later 1103 models, as it didn't cause overload with external antenna (unlike more expensive radios of that class). For some reason, later Degen changed this (adding also some screens, which is good), and my model overloads with external antenna. IRIS is fixing this and other omissions in 1103 in his 2nd review (link at the beginning of the Russian version of the 1st review). Oh, well, - on campings there should not be much overloading - again, not from personal experience, but from feedbacks, De1103 works well on telescopic antenna when far enough from urban core.

Yes, you are probably right - 7600 and 1103 are not inferior or superior to each other - just different. To have it much better, I would need something like Sony 2010 or Grundig Satellit 700 - too big and heavy for hiking and kayaking, hard to find, and even old ones cost nearly the same as when they were in production a dozen years ago.

I just found this on their website:

"Radio Slovakia International (RSI) is back on the shortwave from the 29th of October 2006.

We are coming back to the family of listeners from all around the world, to you, who were supporting us throughout our 13 year long existence.

Shortwave broadcast will again feature shows about Slovakia in English, French, Russian, German and Spanish language. Broadcast for the Slovaks in living abroad in Slovak will also have its firm place among these language variations.

We are looking forward on your letters, suggestions and reactions."

Sorry if someone else has already posted about this, but I didn't remember seeing anything about it here.

Steve

Sorry, when I said prone to fail, I meant as a function of age rather
than design. The Tek 465 has been around for some time now and I would
guess probably 30 years old. A newer brand X (not Heath or Eico) might
be more reliable in that respect. There is a curve which represents
infant mortality and old age failures. I would expect a scope that is
beyond the first year but not so many years older to be very reliable.
>
> "Too complicated"??? Why? Just cuz it has dual trace and delayed sweep?
> Those are -good- features to have in a scope.

Yes they are nice features to have in a scope, but only if you will use
them. It is like buying a 4 wheel drive auto. Most people will never
need 4wd so that it is just more shit to go wrong. For fixing old
boatanchors I dont think delay trigger is going to do you any good. I
beleive in keep it simple principals and murphy law as well. The more
shit you got the more shit will go wrong.
>
> OTOH, maybe a very inexpensive 10 or 20 MHz Heath scope would be a good
> starting point for your friend. They can be had for virtual give-away

Yes, exactly my point. They are less than a hundred bucks on Epay.
There are so many you could probably find one local pick-up.

I would like to hear if others are using simple inexpensice scopes and
how they like and would they reccomend. Also what other gear is needed
to make job easy. I have a lot of esoteric stuff that just sits around
most of the time.

What Lightning Protection product should be used with a Random Wire
setup.

Looking at the Zap Trapper.
I do realized that a direct hit will not save anything though.

Most of what you'll be protecting againset is static (from wind, snow, sandstorms, rain) and induced EMF (near-miss lightning). Direct strikes CAN be protected against, but ya gotta be careful and you gotta not shortcut anywhere. This includes in the money department.

You are protecting a system -- not only an antenna, but also a feed-line and radio. How you protect a random wire directly connected to a portable radio is *very* different from how you protect a receiver plugged into the wall going to a transformer ("Balun") and feedline.

So, what is the radio, and how is the antenna connected to it?

At a minimum, handling static and most induced EMF can be done with something a simple as an NE-2 neon bulb between a good RF ground and the antenna. A far better solution is to use a ceramic gas tube made for the purpose.

Handling more requires more effort. For example, a radio plugged into the wall should have an integrated RF and power solution, such as can be provided by companies such as Polyphaser. At a cost. Now I have several thousand dollars in radios so investing that much in a system is no biggie to me... but if you have an Eton, you probably want to go on the cheap.

So, back to you: What what kind of feed line, if any, what kind of radio?

Definitely NOT thousands..

My setup is shaping up like this...

100 ft random, far end feed, into a 10:1 balum located at the far end
attached to a ground rod, balum feeds into coax which is buried for
125ft to a ground block connected to a second ground rod then into the
house to a Realistic DX-160 receiver.
Am looking at installing the lightning protection at the far end.

In the past, germs were not accepted, the world was believed to be flat, radio was thought to be impossible, the laser (buck rogers ray gun) was thought a toy, etc., etc., etc.

The fact that equations need to involve time (time does not really exist) or the "imaginary" number 377 ohms to describe the "impedance" of the ether proves there is a yet undiscovered "matter."

For now, ether serves as well as any other term ...

Get a clue.

Well, the "balun" will bleed off the static accumulating on the
antenna from wind, etc. But induced EMF will still be a problem.

I'd suggest getting a gas tube and putting it across the hi-Z (wire)
end of the "balun." The place for a "Zap Trapper" or equivalent would
be right behind the radio.

A better choice would be a supressor from Polyphaser (probably about
$70) or I.C.E. (probably about half that).

I.C.E. seems to move around a bit. Someone else should provide the
location since I haven't bought anything from them in a while and last
time I did, Google returned old and new locations.

As for a direct strike? Well, if you get one, without a full solution
-- probably about $400 -- you'll lose the radio, but this vastly
increases the odds of keeping the place to live!

Eric

Hi. I own a new, Sony icf7600GR, delivered yesterday. I am brand new to shortwave radio. I have printed out the Prime Time Shortwave listings of English speaking shortwave broadcasts to America. After noting the difference between the UTC time and my time, I tried finding broadcasts.

Out of approximately 12, I could only get about 3. Is this par for the course? I had the antenna fully extended near my window. I tried the reel antenna but it did not make much of a difference. Can you offer any tips and advice? I'd prefer not to buy an expensive, optional antenna right now, I want to make do with the whip and reel.

Take the radio to a small open field at night and try it out. If ytou
got a big backyard that is good too. I can walk away from the house
and get many stations. Maybe you got too much noise around and it is
hard to pick out stations. You can try different times too. I like
early morning just before the sun comes up too.

regards,
NEO

This is a very interesting web site. One can figure out
the translated text reasonably well. Some of the odd word
substitutions actually make some sense, for instance
"aircraft" or "plane" for radio, after all the radio is sort
of dealing with signals flying through the air. I think
"loom" means "band", again a sort of connection if you think
of a cloth band being made on or a part of a loom. Automatic
translation of a pictographic language is something of a
tour de force.
The AR88 copy looks well made from the photos.

4860. Re: Random Wire - What Lightning Protection??

Newsgroup: rec.radio.shortwave
Date: 2006-12-23 03:23:11 UTC
From: RHF <rhf-newsgroups@pacbell.net>
Message-ID: <1166844191.379753.97190@73g2000cwn.googlegroups.com>
Source record: 101100

Brian,

While many Shortwave Listeners (SWLs) use the
Antenna Super Market Zap Trapper
http://www.universal-radio.com/catalog/protect/2993.html

Many other Shortwave Listeners (SWLs) prefer the
Alpha Delta ATT3G50 type of Lightning {Static Discharge}
Protection because of the replaceable Gas Discharge Tube
{ARC-PLUG} Module.
http://www.universal-radio.com/catalog/protect/4003.html

Then again - still there are others who use several
Shortwave Antennas and use an Antenna Switch
with build-in Lightning {Static Discharge} Protection
like the Alpha Delta 'precision' Antenna Switches
http://www.universal-radio.com/catalog/switch/2415.html
The Alpha Delta Antenna Switches offer three levels of
Surge Protection :
* In the Common Position the Common is Disconnected
from all Antennas
* All Antennas are also Connected-to-Ground.
* Feature a built-in Surge Protector. A Replaceable D-4
"Arc-Plug" Cartridge will divert harmful surges to ground.

hope this helps - iane ~ RHF

Brian,

The Alpha Delta ATT3G50 type of Lightning {Static Discharge}
Protection because of the replaceable Gas Discharge Tube
{ARC-PLUG} Module.
http://www.universal-radio.com/catalog/protect/4003.html
- - - Mount the A-D directly on to your Far-End Ground Rod.
Note - The Balun should be mounted directly on to the
Far-End Ground Rod too.
Rigging - Configure your Antenna's 100-Ft Wire Antenna
Element in the shape of an Inverted "L" with the bottom
of the "L" connected to the Balun 'at' {near} ground level.

hope this helps - iane ~ RHF

>

It depends on where you are in America and
where the broadcaster is. You might be in a
fringe area for a particular broadcaster. And
the listings are probably optimistic.

SWLing is a little like hunting. I don't know
about others but I scan looking for interesting
or surprising signals. Signals that are regularly
there, i.e. similar to a local AM broadcast aren't
that interesting to me. (Although Radio Havana
can be good for a laugh.)

If you are unsure of your radio or antenna then
there are regular signals you can test it against.
WWV is regular by design. Depending on
where you are and the time of day you should
get a good signal on 5 MHz and/or 10 MHz.

Realistically, solid or stranded...makes minor differences in
reception signal capture. But stranded tends to have greater strength in
standing up against wind, ice & snow, and squirrels who seem to like to
Wallenda the length of the yard.

For One and All,
.
RF Systems "MLB" {Magnetic Longwire Balun} - What Is It ?
http://groups.yahoo.com/group/Shortwave-SWL-Antenna/message/11762
.
I 'guess' a RF Systems "MLB" {Magnetic Longwire Balun}
http://www.rf-systems.nl/pdf/mlb.pdf
http://www.universal-radio.com/catalog/sw_ant/1484.html
http://www.hard-core-dx.com/nordicdx/antenna/feed/magbal1.html
http://www.universal-radio.com/catalog/sw_ant/1465.html
http://www.xs4all.nl/~deltron/MLB-ENG.pdf
http://www.universal-radio.com/catalog/sw_ant/4067.html
http://www.qsl.net/wars/construct/mlb.htm
http://www.universal-radio.com/catalog/sw_ant/1465chrt.html
http://www.hard-core-dx.com/nordicdx/antenna/feed/magbal2.html
Can be looked at as a Series-&-Parallel Transformer
with a common ground for both Windings.

```
A C
| |
/ |
/ |
/ \
/ \
/ |
/ |
| |
-G-
```

A = Antenna {Longwire} Termenation/Connection
C - Coax Cable {Center-Conductor} Connection
G = Ground Coax Cable {Outer-Shield} Connection
.
A-to-G and C-to-G would read as near DC "Shorts"
since they are short pieces of Copper Wire.
- - - Also A-to-C would read as a near DC Short
due to the Series Circuit Path.
.
Inductively [AC & RF] A-to-G and C-to-G would
each read as Reactance and function as an AC
Parallel Circuit Path.

The pro-code/no-code debates remind me of the Am/SSB debates on the ham bands back in the 70's.

Electrically, I believe that there is no detectable difference.

Mechanically, stranded wire is used in situations where vibration and/or flexing is present. Needles to say, an outdoor (as opposed to an attic) antenna is subject to flexing and thus IMHO, stranded wire would be the better choice.

Now, you didn't ask about insulated vs. non-insulated wire or regular wire vs. 'Copperweld' (tm). Saving those for another debate, are we?

:-)

OK! i have read this whole thread, so who won? i am not trying to stir it up again. i want to know what is the latest and/or best theory! (i do think that theory is the term because i have not seen proof either way) who is in charge of the last word? i previously understood that radio was a magnetic force, a subatomic energy similar to gravity. and like gravity, its not yet completely understood. (we dont need to understand it to detect, measure or use it) magnetic energy has a spectrum from gravity through radio into light and who knows how far beyond. the particular qualities of this energy depends upon its frequency or position relative to the spectrum. now one guy is arguing on the existence of either, or a medium to propagate the waves. this seems true at one end of the spectrum. the other guy argues on photons or little energy packets that transverse distance like particles do. this also seems true at the OTHER end of the spectrum. where are we on the spectrum NOW? e l f radio is radio but it works very much like a magnetic force. e h f is also radio. radio at gigahz frequencies and above is starting to exhibit properties of light. so where the hell are we talking about on the e m spectrum and how the hell does my antenna work? SOMEBODY here HAS to be the one with the highest education! what are YOUR qualifications and then what is YOUR opinion?

Thanks for the help and replies. I did a little better this morning.
I hung the reel antenna outside and tried to fing stations by
exclusively using the scanning function. I found it's better to let
the radio do the work, do the hunting and scanning. I found many
stations, most of them Christian gospel preaching. I will try again
tonight.

Hi. After a painstaking process of hanging my reel antenna outside,
clipped to the rim of the roof, and putting the screen to the window
back on, I am reluctant to bring the reel back inside every time I want
to try shortwave reception. I want to simply leave it hooked up
outside, in the wind, rain and snow. Is this acceptable? What is the
consensus about my decision? Is it a bad idea?

Greetings all.

I have been noticing lately that what I am hearing on my E1 does not match what is on the PTSW schedules. For instance right now on 9525 at 0343 GMT from North Dallas, I hear Voice of Indonesia from Jakarta to Europe. However the PTSW sched says it is not supposed to be heard until 2000-2100. Right now it *should* be CRI which also corresponds to Passport 2007 ed. I have seen this on many stations. Am I doing something wrong? Is PTSW known to be inaccurate? Is there a more accurate schedule available?

Thanks.

And an alternative to that, and the method in use here, is to have a separate ground coming off the balun and then ground the coax feed where it enters the house.

Using that method there is no connection between the two windings on the toroid.

> OK! i have read this whole thread, so who won?

Among physicists 'no ether' won.

'ether' is an over extended analogy of
acoustic waves. The role of a medium in acoustic
waves is easily and relatively directly perceivable.
That gets added to one's "common sense" and then the
analogy is made to EM waves. But if one goes beyond
just making the analogy and actually tries to measure
this 'ether' it disappears, is contradictory, and/or is
superfluous.

> i am not trying to stir
> it up again.

But it may serve to do so. ;)

> i want to know what is the latest and/or best theory! (i do

The wiki page is pretty good.
http://en.wikipedia.org/wiki/Luminiferous_aether

"today the aether is considered to be a superseded scientific theory"

"... the mechanical qualities
of the aether had become more and more magical: it
had to be a fluid in order to fill space, but one that
was millions of times more rigid than steel in order to
support the high frequencies of light waves. It also
had to be massless and without viscosity, otherwise
it would visibly affect the orbits of planets. Additionally
it appeared it had to be completely transparent,
non-dispersive, incompressible, and continuous at
a very small scale."

"By the early 20th Century, aether theory was in
trouble: A series of increasingly complex experiments
had been carried out in the late 1800s to try to detect
the motion of earth through the aether, and had failed
to do so. A range of proposed aether-dragging
theories could explain the null result but these were
more complex, and tended to use arbitrary-looking
coefficients and physical assumptions. Lorentz and
Fitzgerald offered a more elegant solution to how

the motion of an absolute aether could be undetectable
(length contraction), but if their equations were
correct, the new special theory of relativity (1905)
could generate the same mathematics without referring
to an aether at all. Aether fell to Occam's Razor."

"Today, the majority of physicists hold that there
is no need to imagine that a medium for light
propagation exists. They believe that neither
Einstein's general theory of relativity nor quantum
mechanics have need for it and that there is no
evidence for it. As such, a classical aether is an
unnecessary addition to physics that violates
the principle of Occam's razor."

> think that theory is the term because i have not seen proof either way)

Gravity is something else. Physicists have been
trying to link gravity to the other forces of nature
(electro-weak and strong nuclear) but have not
succeeded.

> through radio into light and who knows how far beyond. the
> particular qualities of this energy depends upon its frequency or
> position relative to the spectrum. now one guy is arguing on the

> energy packets that transverse distance like particles do.

Photons are photons regardless of which end of the
spectrum one is talking about.
At the low end they have very low energy and one
needs of lots of them in order to detect them.
They are also 'longer'.

> this also
> seems true at the OTHER end of the spectrum. where are we on the

4887. Battle: The new Sangean DT-200VX vs, the old Sangean DT-200V

Newsgroup: rec.radio.shortwave
Date: 2006-12-23 17:07:38 UTC
From: dead of night <jruthazer123@aol.com>
Message-ID: <1166893658.573512.273060@f1g2000cwa.googlegroups.com>
Source record: 101127

Hi. I just scissored open the new Sangean DT-200VX and directly compared it to the old, DT-200V.

For the first time, it is possible to scroll through the memories in either direction on the VX. On the old model, you could only go up, and it was very inconvenient. However, you must press a button on the side of the new model to access memory mode. Once you do, the tuning up and down buttons take you through the presets. It's worth the effort. Curiously, once you press the button again to leave memory mode, the radio leaves the current memorized station and reverts to the previous non-memory frequency you were at before accessing memory mode.

The new model has a light, which comes on every time you press a button. It stays on for about 10 seconds.

The new model tunes FM in 10 mhz increments, the old model in .5 increments. For this reason, the new model scans more quickly. Although the new model, the VX, is smaller in size, the display is larger. FM sound is about the same, although the new model has a scant darker sound to my ears. Possibly, this difference is imagined.

I was most interested in AM reception since the new model touted a "better AM reception." On both models, I went to the weakest daytime AM station in my area and compared.

The new model, the DY200VX, was noticeably better in AM reception, even though the old model is respected by all DXers as one of the best portable AM DXing machines available.

I am very happy with the new model and am confident it will replace the old model which will be forgotten forever. The old model simply has no advantages, except that some might prefer the mono button it had, compared to the mono slide switch on the new model.

I have no idea what a PTSW schedule is, but in my experience most
stations have changed their schedule before any of the printed schedules
can be distributed. Also, many if not most stations have a winter
schedule and a summer schedule. Therefore, if you are using a printed
guide that mostly has the summer times and frequencies you may find it
more accurate six months from now than now.

If you are interested in a specific station, the best bet is to find
that station's website using Google. Often you can sign up through the
website to receive e-mail updates when the station's schedule changes.

> YOUR qualifications and then what is YOUR opinion?

EM stands for electromagnetic. All electromagnetic wave energy
according to quantum theory are carried by photons. According to this
theory depending on how or what you measure of the electromagnet energy
it will exhibit particle or wave like properties.

Electromagnetic waves are the theoretical construct used to understand
how this energy propagates. EM waves convey energy in the spectrum of
radio waves from 1 Hz to microwave radar. After that radiant heat
energy, then infra red, then the visual light energy colors red through
violet, then ultra violet or UV, then gamma and cosmic waves.

Gravity waves are not a part of the electromagnetic spectrum. There is no theory connecting gravity and EM waves but people are working on it.

The quantum theory of EM waves does not require an ether. Whether there is an ether or not does not matter. We know that vacuum is not empty so their must be something there. In quantum theory it looks like the foam of virtual particles. In string theory it is other dimensions that are so small we can't see them but people intuitively understand that something occupies empty space.

There are two basic classes of materials conductors and insulators. Conductors like copper have electrons that can travel freely through them and if you apply a voltage potential across a conductor you will cause a flow of electrons (current) proportional to the potential voltage divided by the resistance of the conductor. Most conductors are metals. By definition this resistance is low for a conductor so a few volts with drive significant current. Insulators like most plastics are the opposite of metal conductors in that they don't have mobile electrons. All the electrons are bound in the chemical structure that make up these materials so they have very high resistance and it takes very high voltages to drive a current through them. At normal everyday voltages in the house wiring or in your electronics voltages are not high enough to cause the insulators to break down and conduct a current.

The trick with antennas is that you can get electrons moving through them at a distance and not just by directly connecting a voltage source to it. This can be done with EM waves. These waves carry the electric and magnetic fields that can drive the motion of the free electrons in a conductor. For this to happen efficiently the conductor needs to be the right electrical length for the EM wave we are trying to stimulate it with. The EM wave passing by the antenna element wants to cause the electrons to move a specific distance in the conductor and so the conductor needs to be the right length for this movement. When the size of the EM wave matches up with the right length conductor the passing wave can then efficiently cause the electrons to move in the conductor and we have a good antenna. Visualize a sinusoidal wave passing by a conductor orthogonal to the motion of the wave and you have a graphic representation of the motion of the electron flow the wave generates in the antenna element.

I use the 7600 too. I suggest you get about 20 feet of wire (stronger
than the stuff that the reel antenna is made of). Attach an alligator
clip to one end. Throw the wire out of your window. Either run it
along the side of the house/apt. or just let it drop. Attach the
alligator clip to your radio's antenna (keep the antenna at its
shortest, so no accidents happen where you knock the radio over
because of an extended antenna. (Another option is using the reel
antenna but taking the plastic reel off the wire.) Do note that you
will have to learn to use the attenuator wheel on strong signals.

Those gospel stations are domestic US broadcasters. They tend to be
easy catches (at least the big powerful ones). If you let us know
where you are located, and the stations that you AREN'T able to catch,
other 7600 owners can give you feedback on whether those failures are
normal or not. That radio just isn't going to pick up local stations

in Sumatra or Urumqi.

(See previous post about this.) If I wanted to use the reel antenna
outside, I'd just throw the "reel" away and use the wire and clip. I
mean, do you really need that big plastic reel? How hard is it to wind
the wire without it?

The other suggestion here- speaker wire -- is a good one. If the wire
is going to stay outdoors, get something more rugged than the reel
wire.

Hello "D. of N."

Definitely bad idea. These windup antennas are made for indoor use -
outdoor use only in fine weather. Bad weather will damage/destroy them
and replacements cost at least $12.00.

Take Jim Hackett's very good advice - use cheap speaker wire instead.

Best,

Joe

> y'allselfs.''Time'' does not exist,NO such thing.

Of course it exists. It is the 4th dimension.

Example: when you make plans to meet someone - say for lunch - how many coordinates do you give? You say "meet me at Harry's diner at main and 3rd, at 1:00 o'clock". You give 4 coordinates - 3 physical and one of time.

Length, width, height, duration. There are (at least) 4 dimensions. Saying WHERE something exists is meaningless without saying WHEN it exists. Did Harry's diner exist at 3rd and Main 1 year ago? A million years ago?

Clocks are just the measuring stick. Just as physical dimensions exist independently of feet, meters, and light-years, time exists independently of what we use to measure it.

Clocks, inches, sundials, kilometers, decaying atoms, light-years, quartz vibrations, the movement of Earth around the Sun etc. are all just convenient measuring tools. They all give reference points, so we can say things like "The restaurant is a mile north of here" or "I'll be at the restaurant in an hour". The "mile" has no real existence, it's just an agreed upon definition of a length of distance. Similarly, the "hour" has no real existence, it's just an agreed upon definition of a length of time.

All of the measuring tools and terms we use to define the 4 dimensions are purely arbitrary. What they are measuring, however, is very real. The concepts of before, now and after are as real and universal as up, down, left, right, forward and backward.

Dear "D. of N."

Unfortunately you have picked probably the worst possible time to get started in shortwave radio. We are at, or fast approaching, the "bottom" of the 11-year sunspot cycle. At this point, shortwave reception becomes problematic. Signals can travel farther on the higher frequencies, but these are the frequencies most affected by the presence or absence of sunspots. You will find reception to be generally better in the early mornings and the late afternoons, with nighttime reception to be "iffy." That's not to say, of course, that you can't hear anything at night, just that it will be more chancy until the new sunspot cycle "takes hold," which will occur in just a couple of years. (I should mention to you that sunspots affect the ionosphere which directly affects shortwave reception.)

Your whip antenna and/or the accessory reel antenna will work just fine.

Try tuning to 6165 kHz at 0000 UTC (7:00 PM EST) and/or at 0100 UTC. Radio Netherlands transmits in English at that time and their programs are always interesting. If you can listen in the afternoons, try 12095 kHz at 1900 UTC (2:00 PM EST) and you should hear the BBC which transmits until 2100 UTC. At that time tune to 11690 kHz and you should hear Deutsche Welle. These two broadcasts will get you started. (This is assuming, of course, that you live in the eastern part of the United States.)

Hang in there. And keep trying/scanning the shortwaves whenever you wish. Oftentimes you will hear something totally unexpected and this is one of the joys of the hobby.

Best,

Joe

Our watches and clocks all measure the spinning of the earth, one spin = 24 hours. Now that is all very nice and everything, and it does get me to appointments on time, but it is NOT "real."

Imagine just before the big bang, when all the matter in the universe sprang forth from some sub-atomic particle sized piece into all "our matter" now. And, imagine four old bearded men sitting there and observing the big bang--what do the wrist watches on their arms measure? There is no "earth spinning" to measure time by, indeed, there is no matter.

If time exists, it exists on a "Universal Time Frame." And, no one has "viewed" it yet--just like the ether.

When we finally do know the answers, we will see how it was stupid to try to use "earth spinning" in our mathematics!

4911. Sony ICF-SW7600GR Sale at Amazon.com

Newsgroup: rec.radio.shortwave
Date: 2006-12-23 19:28:30 UTC
From: Joe Analssandrini <analssandrinij@yahoo.com>
Message-ID: <1166902110.017777.291270@a3g2000cwd.googlegroups.com>
Source record: 101050

Hello Everybody.

Interested in the Sony ICF-SW7600GR? NOW's the time to buy it at
Amazon:

<
http://www.amazon.com/Sony-ICF-SW7600GR-Shortwave-Receiver-Reception/dp/B00006IS4X/sr=8-1/ref=pd_bbs_1/103-4054519-3224652?ie=UTF8&s=electronics
>

"Sony ICF-SW7600GR AM/FM Shortwave World Band Receiver with Single Side
Band Reception

List Price: $199.99
Price: $122.22 & this item ships for FREE with Super Saver Shipping.
Details
You Save: $77.77 (39%)"

This price is even better than last year's! (It was $129.15 then!) If
you get some extra Xmas money, you couldn't use it much better, at
least in my opinion.

Best,

Joe

Untrue, you would need "time" to make the universe. Without it, you
could NOT make the universe--you simply would not have the time!

so what are you SC,a fortune teller,soothsayer,prophet or what?
I have been studying the code for a while now and I know all the
letters and everything
but I am very slow with it yet. My goal has been to take the code test
in January,I have already passed the tech and general tests.But I gotta
tell you,all the crap from guys like you
have really been a turn off. "Laziness,dumbing down,end of ham
radio,all that other ignorant crap from a bunch of these people make me
think why in the world learn the code,I sure would
not want to make a contact with one of these guys.No way my sending
would be good enough for these perfect hams and who needs the grief.But
you have it all figured out and know what the future holds for this
HOBBY.So I may go ahead and take the test next month and I might not.In
the end it wont make any difference will it?I really wish you and those
like you would accept the reality of the way things are and let it go,
enjoy the hobby and stop spreading hate and discontent.You just drive
people away with that junk.

> outside in the elements?

Wirenuts with a synthetic grease always worked for me. I"ve seen solder jobs potted in silicone. There are a number of solutions to that kind of a problem.

I recently had the opportunity to drive through one of the neighborhoods of my distant past. I hadn't lived there since 66. The house was still there, in a about the same shape as we'd left it. The screen door on the front still had the number plate I'd made in Cub Scouts...pressed quilted aluminum sheets in natural color with black cursive digits framed with aluminum scroll.

The owners were gracious enough to give me a brief tour.

It hadn't really been changed much at all.

And hanging under the eave where my bedroom had been was the steel wire antenna I had used for my Remco crystal set. It has been painted over a couple of times, but the steel wire, the original plastic insulators (stamped REMCO), were still there. Apparently in use by one of the kids in the house.

Memories.

The connection to an outdoor steel wire is a lot less problematic than it would appear. :)

4917. YEASU FRG-8800 fails to start up

Hi, I have a yeasu FRG-8800 sometimes fails to start up.
I see nothing on the LCD only backlight.
The solution for this phenomen is simpy to unplug the main power
connector and to remove the backup batteries on the backside.
Repower te receiver a the microprocessor is reset, so all works OK .

Kind regards 73's to you all.

Using batteries the backlight works when a button is pressed or the knob
is turned. With mains power the light is always on.

Of course it is real. The clock gets you to appointments "on time" for the
same reason that directions and maps get you to appointments "on spot".

> Imagine just before the big bang, when all the matter in the universe
> sprang forth from some sub-atomic particle sized piece into all "our
> matter" now. And, imagine four old bearded men sitting there and
> observing the big bang--what do the wrist watches on their arms measure?

Who knows? It doesn't really matter *what* they measure! But they
clearly are measuring *something*, or they wouldn't be wearing them, right?
That they have no concept of Earthly hours is irrelevent. Just like the
lengths of their beards are measuring *something*, even though they don't
know about inches or meters or any of our Earthly measurements of length.

As I said earlier, all of the measuring tools and terms we use to define the
4 dimensions are
purely arbitrary. What they are measuring, however, is very real. The
concepts of before, now and after are as real and universal as up, down,
left, right, forward and backward.

Perhaps the Big Bang happens in cycles, every 24 "hours" on their "watches".
As Einstein showed, time is relative to the velocity of the observer.

I don't think it a dimension like the ones you write about but there is
also spin. Spin has several qualities of its own.

Well, you would have no space for it, either! Without space, you could
NOT make the Universe--you simply would not have the space!

If time existed before the Big Bang, then space existed also. You can't
have one without the other.

Our SpaceTime started at the Big Bang. What existed before is pretty much
irrelevant, sort of like How Many Angels Can Dance On The Head Of A Pin.

Source record: 101066

Obviously this is off-topic because what I am looking for is not necassarily a shortwave radio, but it may be. I am looking for an inexpensive AM/FM broadcast band radio that is both sensitive and selective on the FM broadcast band. My application is for using it in a barn. I am transmitting from the house on a Panaxis ACC100S very low power on 88.1 mHz. The transmitter and receiver will be about 150 feet apart. I am hear it with a vehicle radio parked next to the barn. but most of my home radios cannot hear it even with an external antenna because they hear images, intermodulation, etc. Right now I am using an orininal C Crane Radio and it hears it fine, but I want to use that elsewhere eventually. I am giving some thought to finding a used GE Superadio III, but I thought I would check hear to see if there are any other suggestions for this application. I would like to spend under $50, if possible. Also, if there is a source for old component receivers that would work well please advise. Some have suggested that the Kaito KA1103 is both sensitive and selective on FM broadcast. Also, a provision for an external antenna would be a plus.

Time is not a *physical* dimension like the others, but it is equally real
and measurable.

Does something that has 0 duration physically exist? Not in this universe.

Does something that has 0 length physically exist? Not in this universe.

Source record: 101070

Just a reminder we have vintage Pirate Radio broadcasts from the UK
from the mid 1960's. Including Radio Caroline, Radio London and
Swinging Radio England + Others. These are great memories of how Radio
was and a historical document on Pirate Radio. To view our list simply
go to our website at: http://www.palmsradio.com/store.html
Then you have to do quite a bit of scrolling down to the Pirate Radio
section -- You can click to the title and get a full description of
each CD available.

All the best,
Bennie Dingo
Rock-it Radio

The old Radio Shack DX-440 (Sangean ATS-803A) is a good FM receiver, mainly because it's RF Gain control works on FM, not just on AM/shortwave like most radios. I have used mine in situations where other radios only received interference from nearby stations.

They tend to go for more than $50, so it may not be what you are looking for.

4932. Is this the best way to set up my reel antenna for my 7600GR?

Newsgroup: rec.radio.shortwave

Hi. I've completely unspooled the antenna that came in the box with my 7600GR, clipped and hung it outside on my roof, and taped the wire against the outside wall. The wire then comes inside the window and clips to the telescoping antenna attached to my radio. Is this the best way to make use of the spool antenna? I just want to give myself the best reception possible with the gear that came in my box.

If you can access the antenna wire you could extend the range of the
transmitter by clipping on a 48" length of wire. This might increase
the range enough that you would hear the signal on one of your existing
radios. I use this method on several of my fm transmitters and that's
all you need to do. I would see if you can borrow a GE Superradio on
trial. It has a big speaker and has enough power to fill a barn.

What our watches measure is "something", it could just be some undiscovered quality/law of matter, and that is useful--my appointment keeping stands.

However, when you start plugging these things into mathematical "laws" and NOT caring EXACTLY what they are about, it is insane, now it is useful--and one is best using such 'til better comes along ... BUT, you NEVER forget you really DON'T KNOW or DON'T UNDERSTAND what is really happening and are only substituting "magic numbers" so as to get some type of usable results ...

Today there are many things we use without understanding them, this is good, but only a fool says, "Don't worry about what is really going on, this will get us where we are going." Because, without always searching the truths, we will fail to make the new discoveries and start accepting our "made up formulas" as reality.

There are many examples we need to look further, only the fools stand saying we know it all, we cannot even state we absolutely know photons exist! (however, allowing that they do gives us usable theory, for the moment ...)

You, yourself, claim there is NO ether, that space is truly nothing ...

Yet, now you say there would be no space for such in NOTHING? <scratch head here>

The ether appears to permeate everything and every form of matter. It appears there is so much "room" between our atomic and sub-atomic particles that ether flows through it as wind does a screen. Matter fit quite nicely, simply displacing a portion of the ether (perhaps a minor compression?)

But, this is only a "theory", much like the "generally accepted theory." While in high school physics we learn "truths", in the real physics world we realize we lack many answers ...

A few universities still research, construct and do experiments in regards to the ether ... some admit we still cannot prove that the ether is non-existent, and if found to exist, realize we will once again rewrite what we know, a task already done many times.

What material is the siding on you house? If it is metallic, you would
be better off to find something away from the house to hook on to
(tree, cothesline, etc) Wood siding is ok except you tend to pick up a
lot of electrical racket from the nearby house wiring. It is usually
best to get the antenna wire away from the house, but you have to
experiment a bit to see wht is best

Let's cut the BS and sharpen Occam's Razor a bit.

A train whistle will increase in pitch (frequency) as the train comes towards you, and decrease in pitch as the train travels away from you.

If you mount a laser on a space vehicle capable of thousands of miles per hour, the same doppler effect can be see. The light will switch frequencies when viewed approaching as when seen receding.

Liken the train whistle to air, as the laser to ether. Sound cannot propagate in atmosphere faster than a set limit. Light cannot traverse the ether for the same reason. The change in tone is due to "compression" of the audio frequencies due to the increase/decrease in train motion as opposed to the limit of sounds speed in the atmosphere. Same for the laser, the light frequencies are "compressed" due to motion.

Now, I am sure much more complex explanations can be constructed ...

Well, that's the current state of physics, isn't it? We don't know what
electricity "really is" either, but that doesn't stop us from producing
"mathematical laws" that describe it's behavior. Electricity is "real"
even though we don't know what it "really is".

The same applies to gravity, and to spacetime.

Yes Mike, that is pretty much the state of things, let us not leave it there ...

Let's advance some theories, attempt some experiments (even if they are DAMN WRONG!), some answers are bound to fall out of the tree.

But, let's not be afraid to question all which is.

It's not off-topic, for the simple reason that this newsgroup was never
intended to merely be about shortwave listening, but about "distant
reception" no matter the frequency.

The reason the car radio works is because car radios are generally
better designed. They have to deal with both weak and strong signals,
so they have to receive those distant stations and yet not overload
when you drive past the radio transmitters.

The average radio is often designed for "good sensitivity" with no
convern about the overload that comes with that sensitivity. Ironically,
a receiver that overloads might as well be insensitive, because while
it would no longer overload, the overloading prevents distant signals
from being received anyway.

So you get a car radio, and get or make a power supply to run it,
and that's going to beat a lot of radios. And it will be pretty
cheap, since you can get plenty of car radios at garage sales and
the like.

I've been using a Delco digitally tuned car radio as my bedside
radio for a decade, and it is one of the better AM/FM receivers I've
had. On FM, it doesn't overload, and the adjacent channel selectivity
is pretty good. AM isn't as spectacular, but it still beats a lot of
radios.

There's little sense in buying something better, given that your problem seems to be overload rather than lack of sensitivity.

I never said that "space is truly nothing". There are lots of things in space, things that we can detect. I just don't believe in things that we can't detect - like "ether". If "ether" is ever detected and proven, then I will acccept it. To accept something which can not be detected sounds like religion to me.

> Yet, now you say there would be no space for such in NOTHING? <scratch

If you truly had nothing, then there would be no space. But if you have space, you have something. And if you have space, you also have time.

Michael:

I have a couple of very expensive car radios here, digital and were quite good at reception of stations when in service (but were replaced with even more expensive models)

Both have plugs on the back which apparently contain power, antenna, etc. connections--my question is, how can I get a schematic to show what pin of the connector goes to what? And, do you know of a source where I can get a mating connector to plug into them, or is a auto wrecking yard my only choice?

If the signals are collected on the surface of the wire, wouldn't you want to use *stranded* wire? For the same gauge, it would have a greater surface area.

Due to the skin effect I would suggest stranded would also have lower resistance: lower losses delivering the signal from the outer parts of the antenna to the feedline.

But I believe the difference is negligible. Really, the only consideration for a receiving antenna should be mechanical: how hard is it to get the antenna strung and will it *stay* strung once you string it?

I use #14 stranded, sold at Home Depot for home wiring.

I do have a 700' Beverage using solid aluminum electric fence wire. ONLY because it was dirt cheap. The stuff is really hard to work with. (and I managed to snap it twice trying to pull it through the woods)

No, I did not claim that. Local induction fields are a different thing.
Local phenomena depend on electron movement. Far field effects are
carried by photons in EM waves.

Electrons are a particle responsible for the electric field. When
electrons move they also generate a magnetic field.

Yeah, I agree about time. I was mentioning spin, which is not a
dimension like the three spatial and time.

> (and I managed to snap it twice trying to pull it through the woods)

What makes the skin effect occur is electrons repulsing each other. The
higher the frequency the higher the electric field flux so the
electrons tend to occupy the conductor outer skin. Even with multiple
insulated conductors bundled together the electrons would only occupy
the outside of the most outside conductors at higher frequencies.
Multi-stranded wire will not help once you go above a certain
frequency. You would have to calculate using the frequency of operation
and the size of each strand with the number of strands to know if a
litz type wire will help you increase the conductance of a wire path.

Usually this number is less then a few megahertz for most available
litz wire so that type of wire is useful for AMBCB and lower frequencies.

If the conductors are not insulated from each other then they act as one
conductor.

> I'll like it much better than the SW7600GR.

Don't know what to tell you. I have a 7600G and it works great on all
bands. The GR should be no different according to what I know of it.

I don't think I would trust anything less than a welded or brazed
connection over the long term.

4953. What is the most effective method for finding SW broadcasts?

I have found, having started 2 days ago, that there are three ways to search for SW broadcasts:

1. Hunting, one station at a time, on each meter band.

2. Scanning quickly through each meter band.

3. Looking at a list of broadcast times and stations for your area that someone has put together and directly putting these frequencies in.

How do you do it?

Not first-hand experience, - but G and GR are identical, AFAIK. Poor sound was noted by many, and this was one of the reasons why I bought the chinese cometition (Kaito 1103). Can't say that sound is really amazing - probably it can't be too good with speaker of that size. Btw, Sony 7600 GR has been about $149 on Amazon for the last few months, not $199 (and with same free shipping).

The sound waves will also be coming at you faster as the train comes toward
you, and slower as the train travels away from you.

> If you mount a laser on a space vehicle capable of thousands of miles per

Light however, is unaffected by the motion of the transmitter or the
receiver. It is always exactly c.

Again, light is not a mechanical wave. It is particles with some wave-like
properties.

My Palomar MLB uses tinned stranded wire for the HiZ side and this
solders nicely to shiny steel. I then cover with 3M putty (aka CoAx
Seal) and some 33+. Excellent connection and quite windproof.

Since your new to the hobby. I recomend that you buy a current copy of
the book Passport to World Band Radio at your local book store to get
you started.

> ...

No. The speed of sound, in the atmosphere, is fixed, it cannot be exceeded.

What is happening is that the horn is emitting a frequency, just for example, say 2000HZ. But, the speed of the train is moving the horn forward at some speed, what this is causing is a "shortening" of the sound wave being emitted by the horn--while the tone is leaving the horn at the speed of sound, the next instant of that tone wave is being "jammed" at the beginning of the tone wave, and at the speed which the train is traveling--this is effectively "shortening" the length of the sound wave and raising the perceived frequency of the tone.

Or, in other words, if the train is going the speed of sound, it will reach you at the same time the sound its horn is emitting will. This is why you see some aircraft pass over before you hear their sound (sonic shock wave)

Now, throw a rock from the train and (rock speed + throw speed = total speed)--but, depending on train speed vs. wind friction--this speed will decline quickly. Indeed, at some speed, wind friction will make it impossible for you to throw the rock!

Interesting instructions. Looks like the "correct way" utilizes a 9:1
voltage balun between feed and antenna and a 1:1 current balun (called
isolator "AFI 5030" in the diagram) between other end of feed and the rig.

I mostly use #3. That is, I take a list of stations at a given time,
and directly input the frequency of interest. As was recommended,
Passport to World Band Radio is a good place to start. It also has
lots of other info. There are also some good sources on the web. My
favourite is http://www.primetimeshortwave.com, but there are others.

However, #1 and #2 on your list can also be fun. Here again, Passport
can be of help. It has "Blue Pages" at the back that help you identify
a station you find this way (or just keep listening until they ID
themselves.)

These suggestions apply to listening to "world band" broadcasts.
Others can give you advice on listening to ham operators, utilities,
and other things I don't have much experience with. All depends on
your interest.

Have fun,

DWP

I'm not quite sure what you mean by #1 but I mostly do #3 since I'm a
broadcast listener for the most part. I also like to do #2 but slowly as
stations fade in and out so you have to go slow when listening for the
weak stations.

JS,

The "Correct Way" to Install a Longwire Antenna and Balun
by Wellbrook - Using the Far-End Feed-Point Concept
http://groups.yahoo.com/group/Shortwave-SWL-Antenna/message/11773

The "Correct Way" to Install a Longwire Antenna and Balun
by Wellbrook => http://www.wellbrook.uk.com/longwire.html
We have all most likely done it the wrong way more than once . . .

A key-point that Wellbrook makes is the Five Metre "Noise Zone"
that exists around a House and getting the Wire Antenna Element
away {out} from this area.
http://www.wellbrook.uk.com/longwire.html
Note - The above "Correct Way" installation will ensure that the
Wire Antenna Element is 'outside' the local Noise Zone which
extends up to Five Metres (5m) around the House. Also the
noise pickup is lower with the feeder close to the ground -or-
buried under the ground a few inches.
-Why- The Antenna and the Balun are within the Local Noise Zone
RFI & EMF {Interference Area} that surrounds most buildings up to
distance of Five Metres (5m) which is about 16 Feet.

all i ask for is five metres beyond the noise - iane ~ RHF

Carter [K8VT],

Yes most Solid or Stranded Wire may have very little
'difference' Electrically as a Wire Antenna Element.
And Yes - Stranded Wire of the same Size usually is
more durable then Solid Wire.

EXCEPT - For Stranded "Litz" Wire which has each Strand
Insulated from the others and thus has a much greater RF
Surface Area for a given Size OD Stranded Wire Bundle.

ABOUT - Litzendraht Wire [LITZ WIRE]
http://home.earthlink.net/~jimlux/hv/litz.htm
http://en.wikipedia.org/wiki/Litz_wire

TIP - WHEN TO USE LITZ WIRE :
* For short [under 30-Feet] Shortwave Listening (SWL)
Antennas - Consider using Litz Wire as the Multi-Wire
Antenna Element.
* For In-the-Attic -and- In-the-Room Shortwave Listening
(SWL) Antennas - Consider using Litz Wire as the Multi-Wire
Antenna Element.
* For Under-the-Eaves and Hidden [Stealth] No-See-Em
Shortwave Listening (SWL) Antennas - Consider using
Litz Wire as the Multi-Wire Antenna Element.

While it is not Litz Wire "Flex-Weave" Antenna Wire
is easy to work with and durable.

FLEX-WEAVE => http://www.davisrf.com/ham1/flexweve.htm
* Flex-Weave Antenna Wire is a sophisticated "Hybrid"
Aerial Wire.
* Flex-Weave Antenna Wire is sometimes referred to
as "Wire Rope" Ulta-Flexible Aerial Wire.
* Flex-Weave comes in # 14 AWG Wire composed
of 168 Individual Strands of # 36 AWG Wire.
- Bare Wire -or- Insulated Wire -
- - - HEY ! - You Can Always Say : " My Shortwave Listening
Antenna - I Use Flex-Weave ".

Newsgroup: rec.radio.shortwave
Date: 2006-12-24 09:47:06 UTC
From: Mike Terry <miketerry73@btinternet.com>
Message-ID: <xsadnY4Oud0F0RPYRVnyiQA@bt.com>
Source record: 100919

Hello There from Milano,

As every year at this time IRRS-Shortwave will run some additional broadcast at
high power (150 kW) around Christmas and the New Year. Although we will be beaming to Europe, North Africa and Middle East, we expect that reception will
also be possible outside our target ares in the Americas, Asia and Australia.

- Saturday Dec. 23, 2006 on 5,775 kHz (150 kW):
from 1900-2300 UTC (2000-0000 CET): featuring Radio Rasant (first hour) followed
by three hours presented by Radio Marabu

- Sunday Dec 24, 2006 on 9,310 kHz (150 kW):
From 1030-1300 UTC (1130-1400 UTC), a mix of the usual Sunday programs from European Gospel Radio, featuring a special IPAR music program from Radio Six International (http://www.radiosix.com - Glasgow, Scotland) from 1200-1300 UTC
(1300-1400 CET)

- Our usual Sunday schedule follows (150 kW):
on 15,735 kHz from 1300-1330 UTC to India (in English), and
on 5,775 kHz from 1500-1600 UTC to Europe (in German), and
on 5,775 kHz from 1700-1930 UTC to EU, N Africa and Middle East (in English)

Check our special feature: "39 Dover Street" at on Dec. 24, 2006 on 5,775 kHZ
from 1845-1900 UTC, an IPAR program with poetry from New Zealand (http://www.doverstreet.org)

- also on Sunday Dec. 24, 2006 we have a special 30 min. extension, on 5,775 kHz
from 1930-2000 UTC (2030-2100 CET) featuring EMR/European Music Radio from London, England.

- Lastly for this year on Sunday Dec. 31, 2006:
on 9,310 kHz from 0930-1030 UTC (150 kW) we will broadcast a special program from Radio Rasant (http://www.radiorasant.org), the student radio from Sundern
in Germany, followed by our usual Sunday schedule.

We will appreciate receiving your reception reports for any of our broadcasts.
You can email reports@nexus.org - We will reply and answer all your requests

by
email, and forward your reception reports to our broadcasters for further verification by letter or QSL.

We hope you can enjoy our members programs during this Christmas season. For those outside our main target areas, you can also tune to our simulcast streaming on Internet at http://mp3.nexus.org - For further information on our
programs please check our website at http://www.nexus.org - http://www.nexus.org/IPAR (International Public Access Radio) and http://www.egradio.org (European Gospel Radio).

Merry Christmas and Happy New year from us all here at NEXUS-IBA in Milan!

- If the conductors are not insulated from each other
- then they act as one conductor.
- --
- Telamon
- Ventura, California

Telamon - That is my basic understanding. ~ RHF

IIRC - With a 19-Strand Copper Wire like the THHN type
common Electrical Wire used for Household Wiring the
Nineteen (19) Strands :
1 = Center Core Wire
6 = Middle Layer Wires
12 = Outer Layer Wires *
* It is the Twelve (12) Outer Layer Wires that do all
the RF Signal handling and they some what effectively
'shield' the inner seven (7) wires.
* However it is the Seven (7) Inner Wires that give the
Stranded Wire its greater flexibility and durability.

"THHN" -means- Thermoplastic High Heat-Resistant Nylon-Coated
THHN => http://acronyms.thefreedictionary.com/THHN

'''''''''''''''''''''''''

- If you can access the antenna wire you could extend the range
- of the transmitter by clipping on a 48" length of wire.

About 36" to 39" seems to work well.

With Low Power FM Transmitters Antenna "Size" Does Matter.

-IF- You could manage the 'size' of a One Wave Length
Loop Antenna connected to your FM Transmitter then
you would have about the maximum potential local signal.
88 MHz One Wave Length Loop Antenna = 11.41 Feet
which is about 137 Inches -or- a Square with 45.6 Inch Sides.
* Horizontal would give you an Omni-Directional Signal.
* Vertical {Pointed-at-the-Barn} would give you a Directional Signal.
- - - Plain Insulated Hoop-Up Wire and four Thumb-Tacks
will work to build a simple Low Power FM Loop Antenna.

hope this helps - iane ~ RHF

4987. Got A 'Portable' AM/FM Shortwave Radio - Then Build A Small Simple Practical Signal Turn {Random Wire} Loop Antenna For Shortwave Listening (SWL)

Newsgroup: rec.radio.shortwave
Date: 2006-12-24 11:43:40 UTC
From: RHF <rhf-newsgroups@pacbell.net>
Message-ID: <1166960620.551888.166380@h40g2000cwb.googlegroups.com>
Source record: 100927

DoN - Save the 23 Foot Reel {Roll-Up} Antenna for Travel Use.

Got a 'portable' AM/FM Shortwave Radio - Then Build
a small simple practical Signal Turn {Random Wire}
Loop Antenna for Shortwave Listening (SWL)
http://groups.yahoo.com/group/Shortwave-SWL-Antenna/message/11775

Buy a Spool of Insulated Hook-Up Wire from RadioShack and
Rig it as your External Shortwave Listening (SWL) Antenna.
- - - Also buy a 1/8" Mono Plug while you are at it.

A simple Loop Antenna using Four (4) Cup-Hooks / Screws / Nails
at the Corners for Rigging the Wire Antenna Element will work.

How To : Simple Out-the-Window Loop Antenna Rigging
- - - Start by leaving about 5-8 Feet of Wire to use inside the Room.
* From your Window - Up to the Outer-Edge-of-the-Eaves
and along the Eave 10-12 Feet.
* Down to near the ground 8-12 Feet to a wooden stake or
Plastic Tent Peg.
* Along the Ground (near the ground) 10-12 Feet.
* Back Up to the Window with 5-8 Feet of Wire to use
inside the Room.
* Pair the Two Wires that are inside the Room and Twist
them to form a Twin Wire "Twisted" Pair.
* Trim the Two Wires so that they are the same length.
* Strip 1/2" of Insulation from the Ends of the Two Wires.
* Connect {Solder} the Wire Leads (Ends) to an 1/8" Mono
Plug.
* Plug the 1/8" Mono Plug into the External Antenna Jack of
your Sony ICF-SW7600GR 'portable' AM/FM Shortwave Radio.

Enjoy Listening to your Sony ICF-SW7600GR Radio.

hope this helps - iane ~ RHF

Many people know this, but there are likely some that don't.

9 v. alkaline batteries have six 1.5v. cells inside the rectangular can
(smaller than AAAs) that are welded together. This is why 9 volt
batteries (at least in my experience) are somewhat unreliable/high
failure rates. It just takes one of those internal 1.5 v. cells to
fail....or a bad weld or two.

I assume a NiMH rechargeable is the same construction. A "9 V.
rechargeable" is only 7.2 volts....so you are giving up a lot there.
For sure, you wouldn't want to use these in smoke detectors.

>
>What kind of solder? Any special flux or paste used?

No. Please read below and note that tin, lead and steel are adjacent in the galvanic order:

''There is a direct relationship between various types of dissimilar metals when they are mated. Some dissimliar metals, such as copper and brass, when mated cause very little corrosion. There are other metals, however, that react most harshly when matched. Zinc and brass, for example, will cause corrosion with the zinc metal quickly breaking down. If you wish to prevent galvanic corrosion the best means, of course, is to use the same metal throughout your construction. If this is not possible your next course of action would be to assemble materials that have a close relationship on a galvanic metals table. Here is a descending list of metals and their associated relationships in order of the most "noble" or least active.

least active

gold

silver
silver solder
bronze
copper
brass
nickel (plating)

tin
lead
lead-tin solder
stainless steel
iron/steel

aluminum alloys
aluminum
zinc-galvanized steel

most active

zinc

When choosing materials you should try to pick a metal part made from the type closest to the other metal parts you will be using as charted on the above list. It is very important to consider EVERY part of your antenna including clamps and washers. For example, if brass screws are used to hold aluminum tubing in place they will cause a headache when corrosion takes hold. The better choices would be either stainless-steel screws to secure aluminum tubing or brass screws to hold copper tubing.''

http://hometown.aol.com/haminfo/hammingout.html

Again, waterproof the joint.

No. The capacitive coupling to ground should be more that sufficient to
offer a low ohmic resistance to ground.

If it was me, I'd still wrap a few turns around an old ferrite core
taken from a discarded am radio and construct a 1:1 current balun
against common mode. However, I'd also run my coax through pvc pipe
when going underground. In fact, I have a long run of coax from the
shack to the antenna farm done exactly that way.

The best way I've found to find the various active SW stations (ham or broadcast) is to use one of the SDR-Radios like the Winradio G303/G313 or the Flex-radio SDR-1000. They offer a broad band spectrum analyzer window which will show peaks where stations are operating. You can then click of the peaks and the radio will set it's frequency to the peak.

There are also the AOR (and other) Spectrum Display Units which offer similar functionality but I haven't tried these. I find that the Winradio G303 and G313 offer the bast bang for the buck.

4998. Balun vs. Unun

Newsgroup: rec.radio.shortwave
Date: 2006-12-24 16:30:37 UTC
From: John Smith <assemblywizard@gmail.com>
Message-ID: <emm9vg$ll0$3@aioe.org>
Source record: 100938

When using balanced antennas such as loops, dipoles, etc. a voltage balun can be used, however, great detail should be paid to the symmetry of the antenna and even one leg of a dipole being nearer a metal building, trees, etc. can effect that symmetry.

When using unbalanced antennas end fed, long wire, monopole, etc. a unun is better used and will even eliminate most common mode currents.

I think most here really want the Unun ...

Much of the noise you encounter is generated in your own house. Any
balun allows you to run coax near these noise generators, which is
better than just running the bare wire antenna by them.

Source record: 100944

Dear Ismyer,

Just to comment on your first paragraph: Yes, the sound is not the best from a portable radio on music though it is very clear on voice (which is what most transmissions are nowadays). But this problem can be overcome merely by attaching an external amplified [computer] loudspeaker (which you probably already own) to the line output. Or you can attach the line output of the radio to your stereo system. Either way, the sound quality is then only limited by the quality of the loudspeaker or stereo system.

Yes the sync detector "squeals" when tuning with it "on." The user is supposed to turn the sync "off" when tuning. All sync detectors will "squeal" if they are "on" when tuning. Most radios (including the Grundig Satellit 800 and the AOR AR7030 Plus) automatically turn the sync "off" when tuning; unfortunately the Sony does not. However the Sony costs but a fraction of what any other radio featuring a synchronous detection circuit does.

Finally, yes, the radio has no tuning knob. If that is a major problem for you, then this alone precludes your enjoyment of the radio. For me, however, the Sony's positive attributes (including its cost) far outweigh any negative ones.

And at Amazon's current price of $122.22 it's a positive bargain.

Obviously, the above is strictly my own opinion.

Best,

Joe

Dear Telamon,

I own both the '7600G and '7600GR models. The performance is identical. The '7600GR has an expanded and improved feature set (including, especially, non-volatile memories) but, other than the features, there is no other difference.

But I will say that the new features on the 'GR model take a good small portable SW radio and turn it into a very good one.

Best,

Joe

You're right about the overwhelming number of gospel/religious
stations dominating short wave in the States. Considering the
anti-intellectual inarticulate retard who's running this country, it's
no surprise...

dn:

If you know the name of the broadcaster you want, just look up their webpage. Take China Radio International (CRI) for example, just google with some search terms like: china, radio, international, shortwave, english. I did this for you and got this webpage:

http://pw2.netcom.com/~jleq/cri1.htm

then by following the link on the page for english schedules, I got to the page:

http://pw2.netcom.com/~jleq/cri1_skedfreq.htm

which gives time in UTC and frequencies.

I find this works the best for me. All I need is a list of shortwave broadcasters (yes, you can even google for that!) and you are off with many, many broadcasts to keep you busy indefinently!

Warmest regards,
JS

Dear "D. of N.,"

The "Hallelujah - Send Me Money" boys are the easiest broadcasts to hear as most originate within the United States. They have fairly powerful transmitters as there are enough people actually sending them money to allow for this. (It is my opinion - and my opinion only - that "getting into heaven" has absolutely nothing whatsoever with how much money you send these people, but other peoples' opinions differ.)

There are still many far more interesting broadcasts available within the established frequency (meter) bands but if you are interested in "pirate" broadcasts, try tuning slowly from about 6800 to 7000 kHz late at night, especially on holidays and holiday weekends. Patience is required here as these transmissions are weak and erratic. Also take note that to hear them properly you will generally have to use SSB - lower or upper, depending on the broadcaster.

Best,

Joe

The Sony ICF-S10MK2 is an excellent and inexpensive radio - I just ordered a handful from J&R Music for $10/each including shipping (or, try SonyStyle.com). Here is a review of it on RadioIntel.com:

http://www.radiointel.com/review-sonys10mk2.htm

And, this is what I wrote about it on Amazon (a couple, I will give as presents):

I received three of these radios from J&R Music today for $30, including shipping (just ordered two more). The radios were very well protected and were received undamaged through UPS. I own some larger and more expensive digital PLL-tuned radios, but this radio is truly unbelievable - too bad, I wasted time and money on the other radios. This is an analog-tuned radio, which evidentually, has a tuned loop input and may contain the same receiver chip and ferrite-bar, as the much more expensive Sony PLL radios. There is an excellent review of this radio on RadioIntel and look under the "reviews" tab; this radio has almost the same AM DXing capabilities, as a $700 receiver ! The radio is simply handsome and about the size of a 3x5 card and 1 1/4" inches deep, so it definately has some bulk (this is not the typical 1960's-style transistor radio, that I grew up with). This radio has the feel of a quality piece of electronics for only $10 ! The fit-and-finish is very good, the tuner is very tight, the battery compartment cover and antenna fit tightly, handling the radio does not affect reception, and the 2 1/4" speaker much better, than one would expect. I compared its AM nighttime reception to my more expensive

digital PLL radios and it could pick up exactly the same stations (West to WHO 1040 Des Moines, South to 870 WWL New Orleans, and North to Canada, all from Maryland), but without the typical static of cheap boom-boxes, or the typical PLL synthesizer noise. This radio also has an LED tuning indicator, so you will know when the station is right on; also, I have not noticed the typical drifting one gets with analog-tuned radios. I hope Sony doesn't make the mistake of discontinuing this excellent radio.

Uh, JS, you're being a little selective aren't you? His total response (which I included but you so conveniently snipped) was about "spin, dimensions and time". Funny, but his response didn't say *anything* about flares, storms or antenna construction.

Happy Holidays!

>
>

I had an Eavesdropper up for nearly 15 years, with no real signs of aging. And no deterioration in performance up to the point I took it down to move it, and then found that I really don't need it with my other antennae in place.

I have replaced the coax more than once, in that time, however. The jacket cracked. Moisture gets into the coax and performance drops precipitously.

Check your traps for signs of leakage. Not likely, but possible. Especially in direct sunlight, and with large swings in temperature.

Check your connectors for signs of corrosion. Corroded connectors will be a source of ground irregularities and mismatches. Higher noise. And if the inner contact is corroded, reduced signal. But if the connectors are corroded, you're almost always going to have moisture in the coax. Replace it. With a coax of UV resistant jacket.

When you reinstall the coax, a little synthetic grease on the connectors will help seal prevent corrosion, while CoaxSeal or similar application will seal moisture out of the assembly.

Properly sealed, your installation will be trouble free for as long as the coax jacket remains unbroken.

But as another poster commented, conditions haven't been good for awhile. Be sure that's not what you're seeing. No need worrying about things that don't require it.

A scope may be overkill for a simple alignment, but they ARE fun to play with for more exacting diagnostics.

I use a few, depending: A Supreme my grandfather used in his shack. (Bought a NOS CRT a few years ago. At the WWII price.) It's not at all accurate, or even calibrated, with an ungraduated screen, but as a qualitative tool, it's fine. I use a Pocketscope for general work on the bench. A 100Mhz dual trace by Monsanto for serious diagnostics, and a Tek 453 when I need more vesatile triggering/delay sweep. Truthfully, I could get away with the Tek alone. But I have a fondness for toys.

For most boatanchor alignments, I use WWV as a frequency standard, calibrate my signal generator to it, and with a VTVM, pretty much get it done. It's possible to use a scope as a more precise voltmeter for zeroing in an exact position of a trimmer or a slug, but a careful hand, a good eye and a little practice can get you there with only a voltmeter. And remember, you don't need a lot of highly calibrated instruments, here, you're only going for peaks and minima.

I rarely need a sweep generator, or a marker generator unless I'm doing some FM work.

So, your recommendations are pretty much spot on.

> Oh, sorry. I forgot. It's OK for you, just not anyone else.
>
> Happy Holidays anyway!

If you bothered to read other related threads started by the OP the questions revolve around how antennas work, near and far fields of electromagnetic waves. Here there has been an argument around classical and quantum physics and how EM waves propagate. You will have to read other threads to make sense of it.

You however are just Trolling as usual. Must really suck to be you to have to keep changing your handle just so people can read you after being kill filed time and again. Maybe you could actually add something

to the discussion other than the usual Trolling crapola.

I hope you learn to wise up in the new year.

> Brian

You may not need the isolator with the coax buried. There are to many
variables to know for sure such as the soil conductivity. Best bet is to
use one. You could also just clamp on some ferrite cores on the coax to
see if it makes a difference.

The diagram shows the antenna going back toward the house. This might be
OK if that part of the house is electrically quiet but if not you just
wasted your time with the work on the lead in. It would be better to
attach the antenna away from the house so the entire antenna is away
from noise sources.

Only one hour of Coast to Coast is on shortwave (AFN). Also, AFN is
diffucult to receive compared to those southern US shortwave stations.

5036. Beginner Cant Pick up a Single Station in San Francisco

Newsgroup: rec.radio.shortwave
Date: 2006-12-24 21:18:48 UTC
From: Mike Chambers <mchamber@adobe.com>
Message-ID: <1166995128.626944.169300@i12g2000cwa.googlegroups.com>
Source record: 101376

I am a beginner trying to get into Shortwave and DXing. I have a SONY ICF-SW7600 that I used to use to pick up major SW broadcasters such as BBC, DW and Radio Netherlands (about 10 years ago).

However, I cannot pick up a single SW station at all. I am in San Francisco, California, and have scanned almost all frequencies both at night and during the day. I even tried rigging up a simple antennae using some wire, but still I cannot pick up a single SW station.

I have tried to receive in various areas of my house, including ground level, first floor, and outside.

So, does anyone know of a strong SW station that you can pick up in San Francisco / Northern California? I am trying to figure out if the problem is my receiver.

Does this sound like a problem with my receiver?

I am researching a new one, but don't want to get one if I am not going to be able to pick anything up in my area.

Thanks for any help...

The audio portions of the WWV and WWVH broadcasts can also be heard by
telephone. The time announcements are normally delayed by less than 30
ms when using land lines from within the continental United States,
and the stability (delay variation) is generally < 1 ms. When mobile
phones are used, the delays are often more than 100 ms due to the
multiple access methods used to share cell channels. In rare instances
when the telephone connection is made by satellite, the time is
delayed by 250 to 500 ms.

To hear these broadcasts, dial (303) 499-7111 for WWV (Colorado), and
(808) 335-4363 for WWVH (Hawaii). Callers are disconnected after 2
minutes. These are not toll-free numbers; callers outside the local
calling area are charged for the call at regular long-distance rates.

5039. Entertainment radio reaches its centenary

Newsgroup: rec.radio.shortwave
Date: 2006-12-24 22:55:53 UTC
From: Mike Terry <miketerry73@btinternet.com>
Message-ID: <n9mdneOZAvvrmBLYRVnytgA@bt.com>
Source record: 101379

By Kevin Bissett
The Canadian Press
24 December, 2006

It was on Christmas Eve, 100 years ago, that an eccentric Canadian inventor made history when he produced the world's first public radio broadcast.

Reginald Aubrey Fessenden, born in Knowlton, Que., isn't well known in his native land, but his technological feat rivals that of other, better-known radio pioneers, including Italy's Guglielmo Marconi.

With Mr. Fessenden's inventions, the medium graduated from the crackle of Morse code to the lilting strains of music and voice that we know today.

Mr. Fessenden, raised and educated in Ontario, moved to the United States where he worked for Thomas Edison's laboratory, Westinghouse and two U.S. universities before forming his own company in 1902.

His work led him to establish the heterodyne principle, the process of mixing modulated radio signals that remains at the heart of modern broadcasting.

While under contract with the National Electric Signaling Co., Mr. Fessenden worked to find a way to transmit voice messages to the ships of the United Fruit Co.

By late 1906, he had planned a demonstration for his financial backers that was supposed include the transmission of a voice signal across the Atlantic.

But when Mr. Fessenden's 150-metre tower in Machrihanish, Scotland, was destroyed by a storm, he decided to aim his signal at ocean-going ships using his receivers.

On Dec. 24, 1906, Mr. Fessenden fired up his transmitting station at Brant Rock, Mass., a village about 50 kilometres from Boston.

Together with his wife Helen, a secretary and a small crew, Mr. Fessenden started his broadcast at 9 p.m. with a brief speech, followed by an Edison phonograph recording of Handel's Largo.

Mr. Fessenden also performed a violin solo of O, Holy Night, sang a few verses of a song, and read a passage from the Bible.

He then wished his listeners a Merry Christmas and asked them to write him.

"It was the first time radio was used as an entertainment medium as opposed to just a 'help-me-please' medium," said Ed Perry, owner of WATD, a radio station in nearby Marshfield, Mass.

Mr. Fessenden later asserted that the pioneering broadcast was heard as far away as Norfolk, Va., more than 800 kilometres away.

"On Christmas Eve, I could not get any of the others to talk, sing or play and consequently had to do it all myself," he later recalled.

Until that night, radio consisted only of Marconi's crude, coded transmissions -- harsh blasts of electrical energy.

"[Mr. Fessenden] put together what we would now call a show," said Len Arminio, professor of broadcast journalism at Loyalist College in Belleville, Ont.
"On that night, he was the first announcer, the first disc jockey, the first to play live music on radio."

But the only documented evidence of this feat came to light 25 years later, only a few weeks before Mr. Fessenden died, in a letter he sent to a friend. Still, no one disputes his historic accomplishment. Scholars have long assured us that Mr. Fessenden's recollections were accurate.

The inventor earned more than 500 patents during his lifetime, claiming credit for the radio telephone, a sonic depth finder and submarine signalling devices.
While Mr. Fessenden is relatively unknown in Canada, his work has been recognized in Scotland and the United States, where the U.S. Navy named a destroyer after him in 1943.

Still, some historians have concluded that Mr. Fessenden, unlike Marconi, was a lousy salesman who was simply ahead of his time.
Despite his success, commercial radio really didn't catch on with the public until the 1920s.

Regarded as a cantankerous, impatient man, Mr. Fessenden toiled in obscurity for much of his life, fighting court battles over his many patents.
Finally, in 1928, the U.S. Radio Trust paid him $2.5-million in recognition of his contribution to radio technology.

He retired to Bermuda, where he died in 1932 at age 65.

"I'm not sure he promoted he was Canadian enough," said Mr. Perry, whose radio station has planned a few hours of special programming on Christmas Eve.
The station will broadcast a Canadian-produced play based on Mr. Fessenden's life, and there will be a live re-enactment of the first broadcast from the site of Mr. Fessenden's 140-metre tower, which still stands today.

"Fessenden was a true Canadian genius," Prof. Arminio said. "He got lost in the historic shuffle, and that's too bad."

Source record: 101380

But apparently if you go above 2500 maH with NiMH AA's, you get a drop in the number of times the batterys can be recharged. And the further up you go beyond 2500, the bigger the drop. I can't remember the website this information was on. But it looks like 2500 maH in AA batterys is the highest you can go and have the maximum number of recharge times. I'll have to see if I can find it again. But if that is the case, and you want maximum recharge capability, then I wouldn't bother going over 2500 maH. I bought a 4 pack of batteries that were over 2500, (2600 or 2700 I think), and then when I saw the info on the website about the dropping recharge capability, I decided to stick with 2500's and not bother with those that are higher maH.
If anybody has any more info on this tendency of NiMH batterys having a lower number of recharge times when you go over 2500 maH I would certainly be interested in seeing it. Of course there is the chance that the info on that site was wrong. I am going to investigate this more.
Merry Christmas and Happy New Year to all - Cato

If you can't hear buzzing on the radio, in the middle of a city,
there's something wrong with it. Does the AM work? Can you get KGO?
If so, you may want to mess with the Ext Antenna jack, it could have
crud in it. A few cycles with a 3.5mm plug will clean it up.

5042. Why does my 7600GR scan and stop at stations with seemingly no broadcasts on it?

Newsgroup: rec.radio.shortwave

Source record: 101382

Hi. When I put my 7600GR in scan mode, on several meter bands it stops frequently, often at small intervals, but there is no broadcast that I can hear on these stations. The only thing i hear is a loud noise, although the receiver reads "tuned" and the sync lock has locked onto this noise. What is going on here?

Source record: 101383

Yeah. I can get KGO pretty clearly.

Basically, all I hear on shortwave bands is a loud buzzing. I did manage to barely pick up some gospel station from the US (but i couldnt understand what was being said the quality was so poor).

I checked a couple of schedules, and put in frequencies where there should be content, but nothing came through.

I also tried using a Sony AN-61 portable antenae, and that is when I found the gospel station.

You have a broadband local noise source causing interference. The source
could be a light dimmer, TV, or computer. There are other possibilities
for noise sources. Take the radio outside away from the house and it
will probably act better.

No. Quite a bit of difference between a true autotransformer and a
current balun/unun. The obvious physical difference is one
(autotransformer) has a single layer winding, the other a bifilar,
trifilar, or quadfilar winding.

There seem to be fewer strong stations around than there were ten years ago. Still, you should be able to to better than that.

On this model, the mounting for the whip antenna doubles as an antenna switch. Pull straight up on the whip antenna to activate the whip; push it back in to use an external antenna.

A receiver can drift out of alignment over time. Also, this might be one of those receivers with an FET front-end that's easily damaged by stray static electric charges on a long external antenna.

Good luck.

Are you trying to use this SW radio in the same room with a computer? A TV set? Next to a power transformer? Is there broadband over the power lines where you are?

Sometimes during the day there's not much to hear, but I'm guessing that there might be a SW station in Vancouver that you could hear during the day. In the wee hours, you ought to be able to hear Australia and North Korea.

Is it on Christmas (the first day, that is; December 25) that the Pope gets on the radio and broadcasts greetings in several different languages, or does he do that on New Year's Day?

For that matter, is Vatican Radio still broadcasting in analog, or is it in DRM now? What frequencies are good for them?

Thanks.

Just an update on this. I started to get some broadcasts tonight.
Picked up Voice of the Andes, and Radio Havana.

I also figured out that some of the low voltage lights in my house are
causing major interference (loud buzzing). If I turn them off, then it
goes away.

Thanks for the help. I am already getting hooked. Now I just need to
find a good started receiver, and antenna.

SW has lost lots of its luster since the end of the cold war. Radio
Moscow was always worth a listen, and there was nothing on the air to
compare with Radio Tirana. They hated everybody.

From the Southern tip of Africa, a very happy Christmas to all. Enjoy a lovely family day of love and sharing.
Because BBC didn't broadcast the beautiful Festival of nine lessons and carols to Southern Africa this year I am listening to it on the web as I type this in the early morning.
Alas, our children are far away today, but they will phone in with Christmas messages later.
Being high summer here, it will be a hot day with clear skies and the African sun scorching down with temps of 95F/35C expected.
Reception on all the bands this morning were abysmal, hence the listening on the web.
Later this morning we will go to Mass and then in the cool of the evening our neighbours have invited us to Christmas dinner of turkey and other fare.
Have a lovely day everyone.....

For all the newbies and returnees to shortwave radio who can't seem to pick up anything and wonder if their radio is defunct or they are doing something wrong...Dont Worry. The ionosphere is in terrible shape due to sun emissions. Things will improve. In the meantime you can get a lot of the programs on the internet without fading, buzzing or distortion. Try Republic Broadcasting and 365 live as starters.

If you have light dimmers,get rid of them.Also,use regular old fashioned incadescent light bulbs in your home.I use General Electric Reveal light bulbs in my home.They put out a more natural light.I have to change them (with three blonde gals doing the changing,me directing them) out every few weeks,but they are cheap enough.

- Much of the noise you encounter is generated in your own house.

-R- That is true.

- Any balun allows you to run coax near these noise generators,
- which is better than just running the bare wire antenna by them.

-R- OK - But why not move the Balun and Wire Antenna
Element out-and-away from the house and the noise.

Again a key-point that Wellbrook makes is the Five Metre (5m)
{which is about 16 Feet} "Noise Zone" that exists around a
House and getting the Wire Antenna Element away {out} from
this area. => http://www.wellbrook.uk.com/longwire.html

I think I use a quarter amp fast-blow fuse on mine (running off a 20 amp supply, so you want to fuse each device so the thin wire leading to the devices at the end doesn't burn. A wall wart has enough internal resistance to prevent a burning current, but an external high-amp supply does not).

Curiously, you can blow that fuse by inserting a live 12v plug into an idle unit, apparently the result of suddenly charging some capacitor. So you have to turn off the power supply, plug in the ANC4, and then turn the power supply back on.

Anyway it's less than a quarter amp for running.

RHF wrote:
> Are bad Shortwave Radio reception 'conditions'
> {The Ionospere} a sign of "Global Warming"

No. Just like the Earth, the Sun has seasons and weather. Often the storms on the Sun's surface have no noticable effect upon the Earth, sometimes they are so strong they wipe out radio reception. There was a big one last week, it forced the astronauts in the ISS to "hide" in their radiation proof compartments.

The other effect is that in smaller quantities the radiation from the Sun goes in 28 day and 11 year cycles. Raditation from the Sun that affects the ionosphere just enough to improve HF communication, cycles over a 28 day period as different parts of the Sun face the Earth.

Due to the angle of the Earth in Relation to the Sun, more radiation comes in the Summer, and radio reception improves. Right now radio reception in the Southern Hemisphere is much better than the Northern.

Sunspots, which are related to the improved HF reception,cycle over 11 years. Right now we are near the bottom of the cycle. Eventualy it will reach the point in about 5 years where low VHF (10m) signals will travel all around the globe all day.

Then in another 10 years or so, it will go back to being as bad as it is now.

The indicator to watch is the MUF (maximum useable frequency). This is the highest frequency "open" between two spots. There are web sites with realtime display of the MUF for their location.

If you can receive the 20m and 40m (14mHz and 7mHz) ham bands, tune around at about an hour before Sunset (real Sunset, not when it gets dark), you will be able to hear stations come and go as the line of darkness aka "gray line", moves.

IMHO the worse effect of global warming would be Al Gore elected President of the U.S.

Geoff.

At 1057 reported to CAMSLANT that they were being towed by the K. MacAllister to Chesapeake Bay. Also heard CAMSLANT in comms with K. MacAllister.

Most frustrating..... I looked up the web and Radio Vaticano but failed
to find a single reference to the Pope's Urbi et Orbi broadcast anywhere,
though it was said to be beamed to 40 countries.

Reported on BBC, see
http://news.bbc.co.uk/2/hi/europe/6208789.stm

Radio Vaticano does give some SW frequencies and times on it's website

No, the effect of the tape will be negligible.

Is the antenna insulated? If not, are you taping it to anything metal?

(are you sure the Scotch tape is going to hold it long enough to do much
good?)

These are all fine and dandy points but moving an antenna away from a house also means getting it closer to powerlines, cable tv distribution boxes, the neighbor's house dimmers or whatever.

You guys must all be on the farm!

Global warming happens at too low an altitude to affect the ionosphere.
It won't affect shortwave.

(it *could* affect the troposphere, making VHF/UHF openings less - ore
more - frequent. Indeed, many of us VHF/UHF types have noted fewer
tropospheric openings over the last few years.)

First of all, Scotch (tm) tape (even "heavy duty") is probably not the appropriate choice. Without more details of your circumstances, I don't think it will mechanically last in the wind/weather very long. If you need tape to hold up your antenna, it's time to think about some type of re-design.

> Will the antenna lose some of its effectiveness if parts of it are
> covered with this tape?

The simple answer is "no". Tape on an antenna is no different than using insulated antenna wire, which works just fine.

However, if you are taping it against a house (metal siding) or a tree, the OBJECT the antenna is taped to could be lossy (but not the tape per se). Again, time to seriously consider a re-design.

Good luck!

Thanks for encouraging reply, Doug. Yes, the antenna, the reel that
came with the 7600Gr, is insulated and not attached to anything metal.
I will keep an eye on the tape to look for signs of fading.

Virtually no difference (unless the old coax is damaged or water logged). For the length of coax you are probably using, you would be talking about tenths or hundredths of a dB difference--and remember that one S-unit is 6 dB (so you would not see/hear any difference for that small fraction of a dB).

> And what is the best Coax money can buy?

That can be a tough question to answer, depending on your design and application. However, the converse (what NOT to get) is easy to answer.

DO NOT get 9913 coax (air dielectric). It is virtually impossible to keep water out of it. Water will manage to get in on even a molecular level.

Any good quality foam dielectric RG-8 or RG-213 with a high percentage braid coverage will be great for your application.

As a general rule the type of coax has no effect on reception.
Some peopl get pretty fanatical about only using 50 Ohm coax,
but for reception either 50 or 75 Ohm will work fine because first,
the antenna will seldom be a 50 ohm source, and secondly,
the receiver will almsot never be a 50 ohm load. And even
if you have a perfect 50 ohm antenna and 50 ohm receiver,
using 75 ohm coax will result in a 1.5:1 SWR which is very
good even for a transmitter.

I have tested many receivers and I have yet to find one that is
even close to 50 ohms over any significant frequency range.

I am a big fan of foil and braid coax, but very good quality weather
proof quad shield caox can be at almost every home improvement
center in the US. Just look for the coax designed for satellite dishes.

You much pay attention and install the connectors correctly. Mess this
part up and you are wasting your time! Radio Shack has adpators to
convert "F" fittings to SO259, AKA "UHF" connectors, or BNC, or
through several adaptors you can reduce it to 1/8"(3.5mm). If you have
a
small, light weight "portable" receiver care should be taken to prevent
the
heavy coax from pulling your receiver off the table. One workable
solution
would be to use a light weight RCA to RCA video cable with a RCA tp
3.5mm adaptor at the radio side and a RCA female to RCA female and a
"F"to RCA male. I have seen "F" to RCA female adaptors but I doubt
if Radio Shack has the.

Good luck.

Terry

5088. The "CFL" Good For The Planet - Maybe Bad For Shortwave Listening (SWL) Radio Reception

Newsgroup: rec.radio.shortwave
Date: 2006-12-25 15:45:02 UTC
From: RHF <rhf-newsgroups@pacbell.net>
Message-ID: <1167061502.842596.170570@79g2000cws.googlegroups.com>
Source record: 101227

Cuhulin,

WARNING - Got Radio Noise ? Some CFLs produce RFI at 2.65 MHz
(5.3>7.95>10.6>13.25>15.9>18.55>21.2) and 13.6 MHz (27.2)
http://en.wikipedia.org/wiki/Compact_fluorescent_lamp#Other_CFL_technologies

Try Natural {Full Spectrum} "Daylight" CFLs* that are "Daylight"
(5000 K - 6500 K) rated and produce a slightly Bluish-White light.
http://en.wikipedia.org/wiki/Compact_fluorescent_lamp#Colors
LIGHT COLOR => http://www.lightsofamerica.com/light-color.htm
http://www.solux.net/?gclid=CKr0xq_3rYkCFQRDYwodtTThpg

* Note "CFL" means Compact Fluorescent Lamp (CFL)
CFL => http://en.wikipedia.org/wiki/Compact_fluorescent_lamp

Usually about Three-Times (3X) the cost of an old fashion
Incandescent Electric Light Bulb even those nice GE
"Reveal" Bulbs with the Blue Tint.
http://en.wikipedia.org/wiki/Incandescent_light_bulb

On-the-Plus-Side - CFL's use about 1/4 the Electricity
(Power / Energy) as the older Incandescent Light Bulbs.
ENERGY => http://www.lightsofamerica.com/light-cfl.htm

On-the-Plus-Side - CFL's last, and Last and LAST usually
about 6-Times and up to 10-Times the life of the older
Incandescent Light Bulbs.
SERVICE => http://www.lightsofamerica.com/light-cfl.htm

The-Bottom-Line - Overall CFLs have a 'lower' Lifetime Total Cost
then the older Incandescent Light Bulbs. {They Save You Money}

Good-for-the-Planet - CFL's are simply better for the Environment
then the older Incandescent Light Bulbs.
Note - Most CFLs are "Energy Star" Rated
http://en.wikipedia.org/wiki/ENERGY_STAR

TIP - I personally like Lights-of-America CFLs that use the
"FluoreX Technology" in their 'SunLight Bulb' which produces
a Natural Spectrum Light to counter the effects of "SAD"
Seasonal Affective Disorder.
SAD => http://en.wikipedia.org/wiki/Seasonal_affective_disorder
DAYLIGHTS => http://www.activeandable.com/products/241

Note - If you can find them the Lights-of-America CFL
LoA => http://www.lightsofamerica.com/

Model # 2830 S "Mushroom" shaped CFL Daylight Bulb
is rated as a 135 Watt Light Output [this is a good
'replacement for a 100-150 Watt Incandescent Bulb]
with only 30 Watts of Energy use. These used to be
about $8.66 at Walmart - but getting hard to find there.
http://www.budgetlighting.com/store/agora.cgi?cart_id=2934339.6451*Q10V14&p_id=1017&xm=on&
ppinc=search2

WARNING - Got Radio Noise ? Some CFLs produce RFI at 2.65 MHz

Disabled propane tanker now under tow: 4125 kHz USB
``````````````````````````````````````````````````

It is Mon, 10:57am EST (1557z).
According to comms just heard on 4125 kHz USB between USCG
CAMSLANT-Chesapeake and the disabled propane tanker "Maersk Scotland,"
the Maersk Scotland is presently being towed. That is good news.
The Maersk Scotland passed her coordinates as 35-41.x North, 74-20.x
West.
The long but interesting ordeal is drawing to a safe close it seems.
Merry Xmas.

Bob [K5QWG],

My old City Lot 35-Ft-by-150-Ft in Oakland, CA was on a
City-Block that had at its center all the Back-Yards and no
buildings and utilities. Of course the new small size modern
development 'postage stamp' Lots leave little to work with/in
for the Home DIY Antenna Builder.

get me land lots of land to build antennas on
don't fence-me-in - iane ~ RHF

Buy one of the low-cost "slinky" antennas from Ebay. They are the
equivalent of a much longer wire but fit in the space of the wind up
antenna. Mine seems to be surviving outdoors without ill-effect.
Significantly better performance than the wind-up.

Toss Occams' Razor out the damn window!

No. These things are "theory", they can only be "proven" to exist with math--such is the same with ether. While you may prefer to choose this "theory" over all others--that is only your right ...

Higgs bosons are hypothetical elementary particles predicted to exist by the Standard Model of particle physics. These bosons are thought to play a rather fundamental role: according to the Standard Model, they are a component of the Higgs field which is thought to permeate the universe and to give mass to other particles. As of June 2005, no experiment has definitively detected the existence of the Higgs bosons. ...

Source record: 101241

FWIW - Many Crystal Radio Enthusiasts like to use Litz Wire
to build their Radio-Antenna Coils.

Litz Wire [Type 175/46] for Coils, Loop Antennas and
Crystal Radio Sets - Length 50 Feet
http://cgi.ebay.com/_W0QQitemZ300061128335
http://myworld.ebay.com/vanagon/
http://stores.ebay.com/RESCUE-ELECTRONIC-SURPLUS

Note - The right 'type' of Litz Wire can help a Crystal Radio to
perform up to it's full potential in the AM/MW Broadcast Band.

5103. High Quality {Low Noise} Coax Cable for Shortwave Listening (SWL) Antennas ? - - - Why Not Quad-Shield RG6 !

Newsgroup: rec.radio.shortwave
Date: 2006-12-25 18:22:04 UTC
From: RHF <rhf-newsgroups@pacbell.net>
Message-ID: <1167070924.636989.42050@48g2000cwx.googlegroups.com>
Source record: 101243

Lenny,

{Sorry 'if' Reply this is a repost - I am trying again since this did
not show up in a few minutes; after I posted it the first time.}

High Quality {Low Noise} Coax Cable for Shortwave Listening
(SWL) Antennas ? - - - Why Not Quad-Shield RG6 !
http://groups.yahoo.com/group/Shortwave-SWL-Antenna/message/11783

RG6 Quad-Shield works well and is readily available at a
reasonable price. Use "F" Connector to SO-239/PL-259
Adapters as needed. Or have BNC Connectors installed
on the RG6 and then go from BNC to SO-239/PL-259.

WHY NOT BUILD YOUR OWN RG6 QUAD-SHIELD COAX CABLE
WITH BNC CONNECTORS :

BNC RG6 Coax Compression Connectors
http://cgi.ebay.com/NEW-BNC-RG6-COAX-COMPRESSION-CONNECTOR-
PRO_W0QQitemZ200060645007

BNC-to-RG6 Installtion Tool
http://cgi.ebay.com/COMPRESSION-TOOL-FOR-F-RCA-BNC-RG6-RG59-
CONNECTORS_W0QQitemZ160027282846

RG6 Quad Coax Cable
http://cgi.ebay.com/100-Tributaries-RG6QSC-RG6-Quad-Coax-Cable-
New_W0QQitemZ300062354037

-OR- This eBay Seller "ProWireGuy" will custom build you
any length RG6 Quad-Shield Coax Cable with either "F" or
"BNC" Connectors installed.

Georg:

I have heard it rumored, and this is ONLY a rumor mind you; A certain group has formed which holds Higgs Bosons in high esteem, rumored to even "worship" the great boson.

I believe the official name of this group is "Higgs Bozos" and their official webpage being "http://www.Higgs_Bozos.org"

I have not had time to completely research this ... <straight face>

FO&A,

Here is another CFL Daylight Bulb with a built-in Anion
'thingy' to help Purify the Air inside your Homes.
- - - These can help-out in Bathrooms

Day Light CFL Bulb with "Ionic" Air Purifier 23 Watt
http://cgi.ebay.com/_W0QQitemZ4463219015
The EONY-Light is a Negative Ion Generating Lamp for Air Purification.

Note - The Negative Ions (Anions) in the Air 'vitalize' our body
as though we were in a forest, by a waterfall, or at a hot spring.
A Negative Ion is often called "The Air Vitamin", because when
we inhale the Negative Ions, they accelerate our metabolism,
promote vitality, stabilize the nervous system, help us recover
from fatigue and raise our appetite. The volume of Negative Ions
per cubic centimeter (cc) in tranquil, refreshing natural areas
(such as forests, hot springs, waterfalls, and oceans) amount
to about 800- 2000 Ions/cc.

What You Should Know About The Air You Breathe :

1. The average person breathes approximately 3,400 gallons of air each
day - unfortunately much of that air is filled with contaminants,
pollutants, and impurities you just can't see.

2. According to the Enviromental Protection Agency, the air inside
your home can be two-to-five times more polluted than the air outside.

3. Home interior air can contain a variety of contaminants and
pollutants including mold spores, pollen, bacteria, dust mites,
asbestos, radon decay products, and other particles and impurities.

i have seen the day-light and ion better for it ~ RHF

5113. best portable SW radios in past 15 years

Newsgroup: rec.radio.shortwave
Date: 2006-12-26 00:00:33 UTC
From: snow <sandyscamper@yahoo.com>
Message-ID: <BCZjh.16745$sz5.3423@trndny03>
Source record: 101302

I have tried out several SW radios over my 15 years in the hobby. I was thinking about this recently. I have owned the Radio Shack DX-440, Sony SW100,
Grundig YB 400 and 305, Degen 1103 and also a Ham Radio Icom 735. The best portable by far for sound, quality of contruction and sensitivity was the DX-440. The Degen 1103 is a fine small portable, but it still is not in the same league as the DX-440.
The Grundig YB 400 is also an ok radio, though the
YB 305 (no SSB) beat it out for sensitivity. The Sony SW100 was VERY small......still no DX machine. Finally, the Icom 735 though a ham radio was EXCELLANT as a receiver, but it was a $1000 radio new back in the 80's and early 90's, so one would expect good performance. I come to conclusion that though today's SW radios do have some great buys like the Degen 1103......the older radios I have owned like the DX-440 and Icom 735 easily outperformed the newer stuff. Actually I can't think of a radio under $200 that I would want now.....would consider a used 440 or Sangean 803a first. Though I never owned one, I have heard the discontinued Sony 2010 was also superb. Is the newer stuff not as good as far as quality of construction and DX ability goes? Interesting to hear what others think.

Diversified Technologies,Inc www.dtims.com here in Jackson builds some Antennas (and some other Military grade thingys,single board computers and stuff) for the U.S.Marines.I think they are located in the Northeast Jackson area.(I can look em up in my phone book) But unlike some of them antennas and thingys MFJEnterprises in Starkeville sells,I reckon them Marines don't need to tighten up any nuts and bolts and screws,except for when they are replacing them long man pack radio's antennas with the new fangled shorter Military antennas.

Brian,

No problem! The down side is that I won't get a chance to send it to you
until 2 Jan. when I get back to work. I think that Mouser carries all
the components needed to make the filter.

Source record: 101306

Most of the newer stuff uses glass epoxy circuit boards and SMD technology, so actually, it isn't bad. Most of the older stuff did not.
I had an Icom 735, and although it was a good unit, the Kenwood 570 has a better overall receiver. The 735 uses a dual JFET balanced mixer, while the 570 uses the same type of quad JFET mixer that is used in the Yaesu FT1000 series and the Racal 6790. The quad mixer has a theoretical IP3 of +30dBm if implemented properly, while the dual JFET design is typically in the +15 to +20dBM range. Mind you, this isn't bad.
Nothing out of the old portable radio series comes to the Grundig 210 (1971), the Grundig 600 and 650s (early 80s), and to a lesser extent, the Zenith Royal 7000, not to be confused with the later R7000, which is also not too bad of a receiver.
The full audio response of those older Grundig receivers has to be heard to be believed. I gave my Grundig 210, also known as the TR-6001 to my wife. She still likes to play with it.
The Grundig Satellit 700 seems to command high prices, but it is relatively deaf when compared to the older Grundig units.
Probably, the most advanced Grundig radios were the Satellit 600 and the Satellit 650. These were of an upconversion design using a glass epoxy board for the main receiver board. Real optical encoders were used for the main tuning control, as well as a tracking preselector for the front end.
These were the last Satellit models that used the tracking preselector, as well as the Variometer driven RF stage for the LW/MW/MB ranges. They also used a two way acoustic suspension speaker system.
Another receiver that comes to mind is the Philips D2999. LW/MW performance was just as good the the Grundig Satellit receivers. The problem is finding a unit that doesn't have worn out pushbutton band select switches.
It is difficult to get at those switches in order to clean them.
The Sony 6800W, Orange version is a good performer, if you can find one that is working properly. This is also a very difficult receiver to dismantle, making it difficult to service. Some people prefer the version with the white lettering with its shallower skirt selectivity. Both of the receivers are using a Murata "H" bandwidth filter, except the Orange version uses a 6-element CFWS-455H while the White version uses a 4-element CFU-455H in the 455kHz I.F. strip.
The 6-element version has potentially better ultimate rejection, but because the 2nd mixer doesn't have a crystal roofing filter ahead of it the close-in IP3 is relatively poor. Still, it is a fun receiver to play with. If I ever find a clean sample at a reasonable price, I will pick it up again. There is one on eBay right now, but that "as is" reference that the seller uses is pretty scary, especially when this receiver is known to have problems with the sythesizer going out of lock.
The newer Chinese portables aren't bad.....the limiting factor with these units is using only a 2-pole roofing filter at the 1st I.F. This gives

a maximum 2nd I.F. rejection ratio in the 45dB range.
You can see the manifestation of this problem when you hear the (2 X 455kHz) images of the 6MHz band when you tune 910KHz below the 49M band. Since this is a 2nd I.F. rejection problem, it will occur throughout the whole tuning range. An outboard tunable RF preselector will give you better rejection of this problem.
I did get to play with Prototype 4 or 5 of the E5 when it first came out. Too bad they didn't stick with the blue LED backlight for the display. It looked much nicer than that washed out display that they are using now. Now, the E5 was a better performer than the Sony 7600, although the 7600 isn't a slouch either.
There is also the Panasonic RF-2200. This is a pretty good receiver, but it definitely doesn't have the MW performance of some of the better portables. Image rejection isn't the best either, because of its 2MHz 1st I.F. This in itself isn't bad, but with this type of design you really need 3-gang tuning to get that extra stage of image rejection. Anybody who has used this receiver will notice those images that are offset 4MHz from the original signal. Still, it is nice to have that "Collins" looking tuning dial. It was a pretty good deal at the original 140 price tag. It also had a great FM section with super selectivity.
What is my favorite portable? My Sony SW-1, although that only gets about 10 minutes of use every month or so. If it had a larger loopstick antenna, it would be a great receiver. When coupled with the Radio Shack tuned loop antenna, it is as good as the best. SW performance is also very good. Even with the short whip antenna, it is possible to hear atmospheric noise overriding internal noise up at 29MHz. This unit also uses glass epoxy boards.
The reason that I mention glass epoxy boards is because this material has better dimensional stability than the old phenolic boards. Because of this, you don't run into intermittent connections the way that you do with the phenolic material.
The Yaesu FRG-100 uses phenolic boards, but it is such a nice receiver that I have kept mine, in spite of this fact. I keep this receiver in a controlled climate, so it shouldn't have any problems.
One receiver that I have coming from England is a Lo-Kata ADF receiver. It looks like a good design, but the Christmas mail has slowed down progress of this shipment. Cosmetic design is similar to the Lowe HF-150, only in giant size. I don't know too much about it yet; I may end up having to break it open and repair it.
Whenever I do get the chance to play with any of my receivers, it is my JRC NRD-91. You don't see too many of those units around, because they are still sitting on high seas ships, along with the NRD-92, NRD-93, some of the Sailor brand receivers, and who knows what else?

Pete

I would have to say, #1 Sony ICF-2010, #2 RS DX-440

I have a Motorola Communications parts division buyers source book for sale. This book looks like it covers all communications/radio parts motorola has made. The pages show revised 9/92. So it would be good for historical data or someone who maybe a collector?

email me with your offers. Highest offer gets it. If I do not get any offers by 15 January 2007, off to the trash it goes.

Thanks!

Jim

You are better off with a current BALUN type. They have a wider, flatter response and are usually more efficient.

> When using unbalanced antennas end fed, long wire, monopole, etc. a
> unun is better used and will even eliminate most common mode
> currents.

Well, I think you mean noise currents. The signals the single element antenna picks up are also common mode.

Here the voltage type UNUN has the advantage of DC isolation between the receiver and antenna where it can direct static voltage potential to ground. With a receiver plugged into the mains AC supply noise from that system can conduct on the outside of the coax or the coax itself can pick it up if it goes by a noise source. Once it reached the antenna connection it can couple to the antenna. The two circuits of the voltage transformer can be independently grounded so that the antenna RF ground is not the same as the coax ground where the mains noise is going.

Single wire element antennas (random wire, long wire) are a Marconi type where the other half of the antenna is ground. If you only have one ground then RF ground for the antenna is also a noise current ground where they can mix.

The mode these antennas pick up signals is common mode so the antenna needs to be in a RF quiet environment or you are wasting your time. This usually means you need to be living in a semi-rural to rural area or you cannot get the antenna far enough away from your house or your neighbors. I live in an urban environment and a Marconi antenna picks up way too much noise to work well.

I owned a 440 a few years ago, and I did love that receiver. I still collect
portables, but my choice for number 1 is still the DX-398. I have owned mine
for longer than I can remember, and it still performs and looks like new.
The only problem I ever had with it, was when the stand on the back broke
off, but that was my fault. I was in the process of dropping it, and saved
it by grabbing the stand. I was able to keep the radio off the floor, but
sacrificed the stand in doing so.

I like the YB-400 and the 7600 GR, but the lack of tuning knobs keeps them
off the number 1 spot for me. That little 1103 isn't half bad either. I was
pleasantly surprised with it.
The Tecsun PL-230 is a very cool and convenient receiver to have around.
Considering it cost next to nothing, I thought it was a great buy.
For an analog portable, I use the Tecsun R-9700DX a lot, but I still like
the little old Radio Shack DX-397 overall. I've had it about as long as the

398, and it's still is in mint condition.

I love collecting the portables as much as listening to SW anymore.
The low prices give another dimension to the SWL Hobby.

You have the basics of it down pat. In the old books about SW Listening, they used to say there are 2 ways of listening, "Targeting" certain stations, and just slowly tuning up and down the SW Broadcast bands "exploring" for new stations and broadcasts.

I use digital receivers for targeting stations at cerain times and frequencies, but for exploring up and down the bands, I still prefer analog receivers.

There's always been such a varity of signals on High Frequency Radio, USB & LSB, that it has held my interest for close to fifty years now. I have scanners for UHF, VHF, etc, but HF is still my favorite listening.

5134. ABOUT - On-the-Suface Mounted Shortwave Listening (SWL) Antennas

Newsgroup: rec.radio.shortwave
Date: 2006-12-26 10:15:25 UTC
From: RHF <rhf-newsgroups@pacbell.net>
Message-ID: <1167128125.692075.14520@73g2000cwn.googlegroups.com>
Source record: 101324

DoN,

Question - Will Covering an Antenna with Tape negate its effects ?

-R- Plumber's Tape may produce some negative effects. -oops-

ABOUT - On-the-Suface Mounted Shortwave Listening (SWL) Antennas
Note - These Comments are directed at "Receive Only"
Shortwave Listening (SWL) Antennas.
http://groups.yahoo.com/group/Shortwave-SWL-Antenna/message/11785

* With most On-the-Surface mounted Antenna Elements :
The Surface is often the key good Antenna performance.

* Metal Sufaces like Aluminum Siding are a 'no no'
-but- Vinyl {Plastic} Siding is a 'yes yes'.

Stucco with a Metal Mesh-Screen Backing is not good
-but- Wood usually works 'ok'

Aluminum / Steel {Metal} Gutters and DownSpouts can
cause 'problems' with any Antenna that is mounted :
On-Them, Near-Them, Over-Them, or Around-Them.
-but- Vinyl {Plastic} Gutters and DownSpouts are 'ok'

TIP - Two Inch Wide Aluminum {Aircraft} Tape and be
used as an Antenna Element and painted-over to hide it.
- - - But that Old Grey Duck Tape - It Ain't No Antenna.

HOT TIP - "Corry's" Slug & Snail Copper Tape Barrier
for Garden use is sold in 15 Foot Rolls works well
for a Stealth [Hidden] Antenna. Once Mounted {applied}
to a Surface and the Connections have been made; it
too can be painted-over to make it invisable.

Read - Copper Tape {Foil} for a "Stealth" Shorwave Listening
(SWL) Antenna for the Out-Side and for In-Doors
http://groups-beta.google.com/group/rec.radio.shortwave/msg/19aaf3e743f4ba90

IMHO - Under-the-Eaves is the better On-the-Surface
Shortwave Listening (SWL) Antenna mounting location
then On-the-Wall {exterior wall of the house}.
http://groups.yahoo.com/group/Shortwave-SWL-Antenna/message/11784

TIP - Mount the Antenna Element about 2/3 to 3/4 of
the way out from the Wall toward the Edge of the Eave.
+ The Eaves put you "UP" as High as you can get
without getting-on-the-roof.

+ Allow you to "Work Safe" On-a-Ladder.
+ The Eaves are Out-Side the House and a-little-away
from the Interior Man-Made-Noise within the House.
+ The Eaves are on the 'other-side' of what ever Shielding
the Walls and Roof of the House exhibit.
+ The Eaves are Out-of-most-of- the-Weather.
WHY - Mount your "Hidden" {Stealth} Under-the-Eaves
+ + + Better Signal Levels -and- Less Noise

when you 'got to' hide your antenna . . .
look under-the-eaves - iane ~ RHF

- HOT TIP - "Corry's" Slug & Snail Copper Tape Barrier
- for Garden use is sold in 15 Foot Rolls works well
- for a Stealth [Hidden] Antenna. Once Mounted {applied}
- to a Surface and the Connections have been made; it
- too can be painted-over to make it invisable.
-
- Read - Copper Tape {Foil} for a "Stealth" Shorwave Listening
- (SWL) Antenna for the Out-Side and for
In-Doorshttp://groups-beta.google.com/group/rec.radio.shortwave/msg/19aaf3e74...
-

Two simple 'easy-to-build' Stealth [Hidden] Shortwave Listening
(SWL) Antennas to make using Copper Foil Tape.

Start by using Two 15-Foot Roles of Cooper Tape for
a Dipole Antenna -or- better yet a Windom Antenna :

* Use two of these 15 Foot Rolls to make a Dipole Antenna
with a Twin-Lead or Coax Cable feed-in-line.
- 30-Foot Tip-to-Tip = 1/2 WL Dipole @ 19m

* Or use two of these 15 Foot Rolls to make a Windom Antenna
with a 15-Foot Long-Arm and a 9-Foot Short-Arm and Twin-Lead
or Coax Cable feed-in-line.
- 15-Foot Long-Arm = 1/4 WL @ 19m
- 9-Foot Short-Arm = 1/4 WL @ 11m
- 24-Foot Tip-to-Tip = 1/4 WL @ 31m

-IF- Coax Cable is used with these Antennas then a 4:1 Balun
would work well for better overall Shortwave Listening (SWL).

5137. Regarding acoustic echo cancellation using frequency domain LMS algorithm and subband LMS algorithm

Newsgroup: rec.radio.shortwave
Date: 2006-12-26 11:45:55 UTC
From: Aparna Ram <aparnaram84@gmail.com>
Message-ID: <1167133554.933673.47510@n51g2000cwc.googlegroups.com>
Source record: 101327

Dear all,

I am working on the acoustic echo cancellation.I have
implemented the time domain LMS algorithm for acoustic echo
cancellation and it is working fine only for some audio files and not
working for some other audio files which has the large eigen value
spread.So to avoid this eigen value spread now I am working on the
subband LMS algorithm in frequency domain for acoustic echo
cancellation.So now I am searching for the documents of subband LMS
algorithm and frequency domain LMS algorithm in which it is mentioned
clearly which samples are to be considered and why.But I didnt find
those details.But I understood the overall view of frequency domain LMS
algorithm from the documents that I collected and its steps are as
follows:

Step1:For every sample of a frame (ie., 10 m sec data), that sample and
its previous samples, a total of samples equal to number of weights of
the filter are taken(as a full band) and they are converted to
frequency domain using DFT.

Step2:Initially all the weights of the filter are taken as zeros in
frequency domain.

Step3:Then to get the echo sample of kth subsequent sample position its
corresponding input sample in frequency domain(farend in frequency
domain) are multiplied with its corresponding weight in frequency
domain (its corresponding weight).
N(k) = X(k) * W(k)

Step4:Then the corresponding error sample is obtained by subtracting
this echo sample from the desired sample in frequency domain.
Ek = Yk - Nk
where Yk is the desired signal sample in frequency domain.

Step5:Using this error sample in frequency domain all the weights of
the filter are updated using the following formula:

Wk+1(i) = Wk(i) + 2 * muk * Ek * Xk
where Xk is column vector containing the current sample and its
previous samples.
Wk is the column vector of all the weights of the filter.

Step6:All the above steps are repeated for each and every sample of the
frame untill the end of the frame and is repeated for all the frames of
the audio file.

My doubt is in the calculation of desired samples in
frequency domain ie.,Yk .According to logic, I think these frequency components are calculated using all the samples of desired signal of a frame.But it is nowhere mentioned in the documents that which samples I need to consider for this frequncy band desired samples Okay if we generate frequency domain desired samples equal to number of desired samples in time domain using all these time domain samples.If I integrate this idea with the subband LMS algorithm then again I am getting the doubt that for each subband of farend signal(ie., obtained by dividing a full band of farend signal consisting of current sample of the frame and its previous samples to a particular number of subbands)whether we need to have the same desired signal frequency component for all the subbands or different frequency component for each subband and how it is calculated.I have these type of doubts and if we think of that there may be several possibilities.

So I am searching for that, but I am not getting the
required points.

I think one solution for this is converting the code of
time domain LMS algorithm to frequency domain and checking the code for all the possibilities by trial and error method and seeing that for which combination we will get the perfect output.But I am not getting the output.

Here I have converted the farend signal, desired signal
and weights of the filter are converted to freqency domain and after performing the operation the error signal is reconverted to time domain.And the convergence weight factor is given in different ways in different documents.I am in total confusion to proceed further.

I am very greatful to you if any one give me suggestions
and guidence regarding this.

Thanking in advance.

Regards,
Aparna Ram.K.

Since you brought up the Icom 735: A very nice little receiver that is
available on the used market for around $350.00

As Pete mentioned the Kenwood 570 is also a good radio, and there are
many other older Ham radios that will outperform most of the portables
that Snow mentioned. But alas, not portables.

While the performance and features of these import portables seems to
be improving with the likes of the Etons, it would be nice if someone
made one built with high quality materials. These recent offerings are
just like most other consumer electronics today.....disposable.

Thanks Brian. Nice website you have there! I like that R-388.....a very clean sample. I've had a few of those over the years, anong with a 51S-1. While the S-1 was a nice receiver, it still didn't have the nice construction of the 51J (R-388) series.
An old friend of mine had one of those units set up on his test bench, tuned to WWB, with the BFO turned on. This receiver accidently fell off the bench, and he told me that it didn't shift frequency! Now, this could be an exaggeration, but those receivers were pretty solid.
About the Sony SW-1.....the only issues I've run into with that receiver were the electrolytic bypass caps for the audio amplifier and the synthesizer drifting off frequency. Once you get the receiver apart, it is pretty easy to replace those electrolytic caps with SMD tantalums and get rid of that howling problem with the audio.
The synthesizer is also pretty easy to set back on frequency. A nice receiver. If anybody ever needs the service manual for this receiver, I do have it in PDF form.

Pete

What do you mean, "not working"? Does it not work at
all or does it not cancel the low eigen value echos?

> So to avoid this eigen value spread now I am working on the
> subband LMS algorithm in frequency domain for acoustic echo
> cancellation.So now I am searching for the documents of subband LMS

>
> Step3:Then to get the echo sample of kth subsequent sample position its

Your use of 'k' is ambiguous. "subsequent sample position"
sounds like individual sample in the time domain. But 'k'
is often used as the frequence domain variable, as in:
X(k) = DFT[x(n)]
And then in step 5 you seem to be using 'k' as the iteration
or frame number.

> corresponding input sample in frequency domain(farend in frequency
> domain) are multiplied with its corresponding weight in frequency
> domain (its corresponding weight).
> N(k) = X(k) * W(k)
>

> Wk is the column vector of all the weights of the filter.

Here it looks like k is the iteration or frame number.
Is that what you mean?
What is 'i'? It doesn't seem to fit.

Or is 'i' the iteration number and k just denotes that
it is in the frequency domain. But then 'k+1' doesn't
fit.

>
> Step6:All the above steps are repeated for each and every sample of the
> frame untill the end of the frame and is repeated for all the frames of
> the audio file.

It seems to me that once per frame would be
adequate and that once per sample would be
a waste.

>

Dude, one DFT of all the samples of the frame gives
you all the subbands. There is no need to modify
the time domain samples in order to split the frequency
domain into subbands.

>

Naaa. You can call the damn things anything you wish. It is only if
you expect to be able to achieve maximum performance that you need to
know the correct terms, use the correct devices, etc.

Rumor has it, all heterosexual stations have been banned in SF.

I think your gay mayor only allows reception of homosexual stations with a gay agenda--well, that is the word on the streets! <straight face> (pun intended!)

David,

Thanks for the reply. I know I can hear this by phone or on a ham set.

My grandfather was K9HKE, and when I was growing up he often just had
this going as background noise. I was thinking about him and thought I
would like to just have it as background noise again but I do not have
my ham license.

That's why I thought a stream of it would be nice.

The atomic clocks you buy receive their signal from WWV on 60 Khz. That is a data signal or as you call it a stream.

They do not receive the signal from any other WWV source.

Not likely.

There was a time when there were clocks that got data from WWV, but
they tended to be expensive and were never a mass market item.

The recent wave of such clocks use WWVH at 60KHz, and of course
they'd have a built in antenna. But these are far more common
than the old clocks that used WWV.

That's the conventional terminology. I capitalize to make the acronym
obvious.

Five reasons I can think of to use some type of transformer.

1. Impedance transformation.

2. Matching a balanced or unbalanced antenna to the same for the feed
line used.

3. DC static electricity isolation.

4. Isolate RF ground from AC mains ground.

5. Decouple the antenna feed from the antenna so the feed does not act
as part of the antenna.

Interesting. So, these battery operated 60 hz atomic clocks just pull
that powerline frequency out of the air, huh?

While I can accept powerline operated clocks get their data stream from
the powerline--how are you proposing the battery operated ones do?

A little thick are we?

They have a built in antenna and are typically updated in the middle of
the night. Usually 2-3 am in the central us.

I see there is at least one other person who "knows" the facts on here.

The last clocks that updated via shortwave, ie: 2.5, 5.0, 10.0,15.0 or
20.0 mhz were built years ago. Heathkit made one available.

5163. QSL cards

Newsgroup: rec.radio.shortwave

Name: Kirill
Call: VE3AXC

Merry Christmas and Happy New Year everyone! I will be a subscriber of this forum from now on, so nice meeting everybody!

On this note, please allow me to stray a bit off this forum's topic but my info might still be relevant for some. I myself have been a ham for 8 years; also run a small QSL card printing business (my printishop is located in Toronto, Canada) and have a web site specifically dedicated to that www.qslcanada.com

Reason I would like to post this message on this forum is to let your group know that I have a pretty good group referral discount program.

The idea is quite simple and there is no catch.... For each HAM who is referred by you and who wishes to place an minimum order of 500 cards, you would receive 100 (custom designed) cards of the same type free of charge. The offer is transferable, so if for example you let me know that you don't need any more cards, I will be happy to print additional 100 cards for your friend free of charge (or charge for 100 cards less)

This offer may be ideal for your group or a club you belong to. For example, if you
refer say 3 HAMs who would like to print a minimum 500 cards for themselves, you would receive 300 cards as appreciation for spreading the word about qslcanada
; you could transfer it to someone as a gift ; or each of 3 Hams would only pay
for 400 cards, since each one will get 100 cards free. To sum it up, each of the referral counts as 100 free cards in any shape or form. Pse let me know if you have any questions.

So if bunch of Hams in this group who are into QSLing might be interested to giving someone a free gift or getting a good deal on the next batch, pse let me know. The offer is valid any time in future. www.qslcanada.com has quite a bit of samples, more info and e-ham reviews

PS Have got to mention this, since it did happen before, where some folks took this posting too personally. I just wanted to get this info out there ONE TIME ONLY! Please don't call me any spammer names or hate mail me. I believe this to be a fair group offer any hams by hams enterprise deserves a little exposure to start out with.

I will try to participate in this group from now on, so best 73 to everyone! Happy New Year!

The question was answered, 60 khz. That is a data stream but if one has
a sufficient antenna, it can be heard.

Maybe if you wrapped enough around that malformed skull of yours, you
would have enough wire to pick up a longwave signal.....judging
from the shape of it, I would estimate 863 ft. of 22 ga. wire, that
should be sufficient. The oval shape of that wire would receive quite
good if your were to face approximately 10 degrees on a compass reading.

60 Hertz?

Oh, I get it, you didn't take reading comprehension 101 either.

Read again, 60 KHZ or as they said in my day, 60 KC.

Jesus Christ you are one dumb SOB!

You must work for a public utility company.

My clock is battery powered and receives the signal on 60 KHZ, as in KILOHERTZ or KILOCYCLES, whichever you prefer. All the battery powered clocks built in the past several years are battery powered.

Get a life, you friggin' dumbass!

Happy New Year.

JS,
It appears you do indeed have a comprehension problem.
(I thought it was just a quirk in our go-around a day or two ago, but
you've gone and done it again). Please note that
the poster said 60 *KILO* hertz, NOT 60 Hz. And it's NOT from the
powerline but rather WWVB that transmits a radio signal on 60 *KILO* Hertz.

From NIST (those fine folks that bring you WWV, et al):

> NIST radio station WWVB is located on the same site as WWV near Fort
> Collins, Colorado. The WWVB broadcasts are used by millions of people
> throughout North America to synchronize consumer electronic products
> like wall clocks, clock radios, and wristwatches.

Please note the word "wristwatches".

A more detailed description is at:

http://tf.nist.gov/stations/wwvb.htm

Hope that explains it...

Happy New Year

An astute mind would have caught, quickly, I was ignorant to the 60 Khz
signal from WWV. I have only used the 2.5Mhz, 5Mhz, 10Mhz, etc. signals.

The rest you so minutely explain, that was obvious to me ...

I'm not sure what Steve reads, though how can you go wrong with "Barely
Legal"? :-)

I recently let my subscription to Popular Communications lapse as it wasnt
all that interesting (to me anyway) so I'm also in the market for some new
reads.
Was thinking CQ perhaps, or MT.

If you think that's weird,,, how come Sheriff Andy Taylor doesn't get hitched? (Deputy Barney Fife too) There he is living in Mayberry with his little boy and Aunt Bee since back in the 1960's and he hasen't gotten married again yet.

I still like to watch those old Andy Griffith rerun shows on tv.Last night I watched one where Barney Fife sent twelve pretty wimmins over to Andy's house and Andy made Barney run all of them wimmins out of there.

Well technically only Cannon makes XLRs but the term is used for
Neutriks as well.

That's RS for you - many times I have told them I wanted new-in-the-box, but they made up some damn excuses and gave me returned items. God, I hate shopping at RS. Maybe, you got my S350 that I returned - I opened it up, before I returned it, and some washers fell out, but I couldn't figure out where to put them ! Anyway, here is my review of the piece-of-shit S350 off Amazon:

"Million-Dollar Looks for $100" - Analog w/digital display receivers do

not have the stability of digital phase-locked loop (PLL) receivers.

I opened up the back of the radio, before returning it to RadioShack - it was mostly hollow inside, very cheap, low-grade plastic, and with 1960s-grade electronics. The front filter and band switches and tuning knob are flimsy. When putting the radio back together, I was very careful not to over-tighten/cross-thread the screws, but as soon as, one of the screws started to tighten down, the plastic started to crack. Because of the very cheap quality construction, the radio is very light-out-of-the-box, until the 4 "D" size batteries are inserted.

The filters do a minimal job and only muffle the very good audio. The RF gain control can always be set on maximum, so it only acts like a DX/LOC switch. Even the newer model drifts off the tuned frequency, despite a kludged fix, that only causes ergonomic problems - once a frequency locks on, it still drifts, causing one to have to retune way past the desired frequency, to break the lock. The S350 has significant

tuning backlash, which is partly responsible for the frequency drift. There are images all over the SW bands, being a cheap, single-conversion superhet. There are no station memories, so anytime the band selection changes, the radio has to be retuned to the desired frequency. The speaker grill is plastic, the digital readout is low-resolution, the antenna doesn't lock into place, and the carrying handle is cheap, smelly, imitation-leather.

Instead, I bought a Radio Shack AM/FM (for AM DXing) model 12-898 for $25; it has digital PLL tuning (prevents drifting), DX/LOC switch, hi/low tone switch, 3" speaker with metal speaker grill, internal ferrite-bar antenna, lock switch, 20 station memory, almost as sensitive as the S350, and much better quality - even the antenna locks

into place.

Don't be fooled by the "Grundig" name - it used to be made in Germany, but is now made in China, by Tecsun/Eton. Check out the Tecsun/Eton brand of this radio on Amazon (same junk), and show, "lowest rating first", also, look at the reviews for Grundig G2000A. Tecsun/Eton is becoming known for marketing jazzy, pretty radios that are poor quality/performers; they bought the rights to market products, under the "Grundig" name, hoping consumers will think they are still made in Germany.

With all that being said, with the restructuring of the 50K watt clear-channel AM stations, in the 1980s, AM DXing is not what it used to be, in the 1960s and 1970s. For example, many stations out West now have to use directional antennas, that cannot be picked up on the East Coast. All the hype about the CCradio, Superadio III, and S350 being, "DX machines", is nonsense, and with the clear-channel situation, certainly not worth the extra expense. With the Radio Shack receiver, I

can easily pick up WWL 870 New Orleans (1000 miles), WHO 1040 Des Moines(900 miles), WABC 770 New York, and my favorite, WLW 700 Cincinnati - same as the S350. These stations can easily be picked up with standard car radios.

For just, as little as $30 more, one could purchase the Sony ICF-SW7600GR instead, with digital PLL tuning, dual-conversion, SSB, and synchronous detection; or, for $45 + $20 S&H, off Ebay.com, one could purchase a new Degen 1103 with digital PLL tuning, dual-conversion, and SSB (the S350 has none of the above).

Sorry...

5219. Shortwave Paper Log Books / Templates?

Newsgroup: rec.radio.shortwave

Does anyone know of any shortwave paper log books for logging station reception? Or even better, know of any templates that I can download and print out myself?

The only ones I have been able to find are listed at universal radio:

http://www.universal-radio.com/catalog/bk_log.html

Lots of great radios out there. A friend of mine once had the Kenwood 5000
and it was very sensitive. He lived in the country and was able to put out
some good home made antennas including a 2000 foot longwire for the am band.
I used to live in a rural area and then moved to a town and I noticed the
difference. With less space it beocmes a challenge to set up antennas
outside. Also, more electrical noise.
There must be some good portables that reject electrical noise, etc. I was
told the Sony 2010 does a good job. The only good radio thus far I have had
reducing noise is with the larger and more expensive Icom 735. Portables
really picked up house and street electrical stuff alot. This was not as
great an issue when I lived in a mobile home in a rural area.

You know, I bought a few weeks back when I got stuck out of town. I tore apart "the closet" and found the packaging, no plastic bag for the radio in the box--but I could have tossed that so, that in no reliable "proof"--sorry I cannot help you more.

While not as sensitive as my commercial receivers, it ain't that bad for the price--in my humble opinion ... but then, I have gotten used to stuff made in china :(

Radio Shack has a pretty liberal return/exchange policy.
I would simply exchange it for another unit.

saw him up at The Apollo;

I was so young I didn't realize that the whole thing was choreographed,
start to finish.

every step, every lighting change every note.

Did a Heck of a show..

The audience up there was usually kind of cool..

- Not for James. Had the whole place in the palm of his hand

Came out with that third cape, the place went insane.

Rest in Peace James, you've earned it

I agree with Doug on the Home Depot #14 stranded. I think I paid about 11 bucks for a 500' spool.

Got a question for you Telamon. I think you are power supply guy like me. Why is it that for Ham radio tank coil people don't use litz wire? Most tank coils are made from Copper tubing I see. I suppose the surface area of a 3/8" copper tube would be fairly large and does ok, and litz would require a coilform. The reason I asked is because I remember a large battery charger at UW *Go Badgers!* It was a large resonant 500kw battery charger that used some litz wire.

Wavetrapper has a good point. I've tried a few of the S350s and some
were much worse than others on tuning backlash. Take it back to RS and
ask for an exchange. You may get lucky!

its a huge internet but its still a small world! i stumbled onto another forum while doing a google search. (allfourradio.com - scroll down to "radio shortwave") this forum is the same as this one, including the all the flames and off-topic posts and politics and trolls..... everything! there is a retard who posts hundreds of completely random thoughts (often involving his "wimmins") having nothing to do with anything, a guy from michigan who seems intelligent but flys off in vicious scathing unprovoked (often hilarious) flames. there is a guy who is wasting valuable effort on the demise of another guy named radiomart (uh, mike.... think pearls and swine!) and still another one who is so smart that it takes advanced physics to decipher his comments! another guys flames often exhibit a tell-tale anal fixation! there are too many recognisable personalities (not to mention sig-lines) to remember! its deja-vu all over again! (it couldnt be the very same guys, could it? posting the same stuff against the same people in at least two different places? that would be redundant!)

i was surprised to find that the black plastic spiral cable wrap that i was using as abrasion protection for a cb antenna shot my swr all to hell! its heavy vinyl plastic but i thought that it would be rf transparent! who can explain this? as far as the thin scotch tape goes i dont think there will be any effect. especially for receiving where the antenna is not tuned precisely on frequency. however the tape WILL rapidly fail due to uv from the sun. i presume that you are using clear packing tape for shipping boxes? its strong stuff but NO good against uv. how about foil tape used in alarm systems as the element and fastening system combined? it will stay on a smooth surface for years and years!

It's already been tested on FM in Toronto.

But this is a LONG way from allowing HD under the normal rules. The CRTC released a proceeding on digital radio about two weeks ago, in which they said they would *consider* authorizing IBOC *if* the interference issues could be addressed. I took that as meaning they have no intention of authorizing it under its current parameters.

The CBC in particular has problems with IBOC. They say flat out that it's not practical to run on AM at night. Even on FM, they're worried that it will complicate their ability to roll out enough transmitters to meet their mandate for national coverage of all four networks.

The only really positive comments about IBOC were filed by Ibiquity.

- Why is it that for Ham radio tank coil people don't use litz wire?
- Most tank coils are made from Copper tubing I see.
- I suppose the surface area of a 3/8" copper tube would be fairly
large
- and does ok, and litz would require a coilform.

Why Cooper Tubing -over- Litz Wire :
Raw Power Handling Ability and Relative Lower Cost.

yes it is that simple - iane ~ RHF

My LMZ-50 just arrived today.
Yesterday I strung up the 14 gauge stranded wire with the near end at least 15 feet from the house. I was really surprised how hard I had to pull on the far end feed nylon rope to get the 85 ft of wire and 40 ft of nylon rope on the house side somewhat tight. I also ran the RG-6 coax from the near end ground rod to the reciever area indoors.
I installed another ground rod at the far end and I dug 125 ft of shallow trench for the coax last Saturday.
Will buy the black RG-6 today.
Hope to up and listening tomorrow.

Thanks for your guidance in this install.

Brian

Sadly, there aren't too many receivers with good audio and tone controls out there these days, but I do like my rebranded Redsun RP2000 (Roadstar TRA-2350P; you may be interested in the "service manual" available online, looks like an oldschool engineer was at work there). Even when using headphones, tone controls (particularly for highs) are highly useful in obtaining maximum AM intelligibility / fidelity. The muffled audio on my 7600G bothered me for a long time. (This also has another flaw, fixed with the 7600GR: Somehow some severely undersized audio coupling caps sneaked in, limiting bass response and degrading audio quality even further.)

> The Grundig Satellit 700 seems to command high prices, but it is relatively
> deaf when compared to the older Grundig units.

Supposedly these sets have issues with suboptimum frontend tracking alignment right from the factory, which would explain the deafness. (They also have their share of age-related problems now.) Given a consumer-level 1st mixer, frontend tuning may improve strong signal handling dramatically - the Redsun frequently shows 2nd order intermod here especially with its high maximum RF gain (but never 3rd order), and the AN-LP1 really works wonders with that.

> The newer Chinese portables aren't bad.............the limiting factor with
> these units is using only a 2-pole roofing filter at the 1st I.F. This gives
> a maximum 2nd I.F. rejection ratio in the 45dB range.

That's about right, the Redsun is spec'd with ">40 dB". However, my Sony 7600G fares worse than the Redsun here.

> You can see the manifestation of this problem when you hear the (2 X 455kHz)
> images of the 6MHz band when you tune 910KHz below the 49M band. Since this
> is a 2nd I.F. rejection problem, it will occur throughout the whole tuning
> range.

In many cases, this even extends to MW/LW (again, e.g. 7600G). The Redsun thankfully got electronic frontend tracking like you'd see on a single conversion set, thus the image rejection claim of ">60 dB" for MW seems reasonable. (It's a good rx on this band in any case, even the wide filter - a 6-pole 12 kHz job - is quite useful. Only the old ICF-7600A beats it when it comes to background noise on weakish

stations, but that one has a bit worse selectivity and may apparently
inadvertantly catch some shortwave stations at times, as the MW mixer
and SW 2nd mixer outputs are tied together and sharing an IFT.)

> An outboard tunable RF preselector will give you better rejection of
> this problem.

That, and the intermod. IMO a tunable active loop antenna helps out
"normal" receivers a lot.

> I did get to play with Prototype 4 or 5 of the E5 when it first came out.
> Too bad they didn't stick with the blue LED backlight for the display. It
> looked much nicer than that washed out display that they are using now.

Using blue LEDs for lighting is not a good idea if you're running on
batteries - our eyes are much more sensitive to the light emitting from
less flashy-looking amber and green LEDs, and IIRC those should also
have a higher efficiency.

> There is also the Panasonic RF-2200. This is a pretty good receiver, but it
> definitely doesn't have the MW performance of some of the better portables.

Interestingly, many people seem to state the contrary, though I have
read hints that there may be better but less well-known sets out there.
The Panasonic's rotating antenna is quite unique and gives some definite
advantages over having to rotate the whole set.

> signal. Still, it is nice to have that "Collins" looking tuning dial. It was
> a pretty good deal at the original 140 price tag. It also had a great FM
> section with super selectivity.

Yup, 3 IF filters in there. With 3 carefully matched modern-day 180 kHz
filters, it would probably make quite a good FM DX machine. (The Redsun
features two 180s, which already give it good selectivity for a
portable. Sony never bothered to put in anything narrower than those
cheap 280 kHz barn doors.)

Oh, and would you mind sending me said SW1 service manual?

After my miserable experience with the S350, I went out and bought some
inexpensive Radio Shack digital PLL radios. Well, I compared the
digital radios and my digital car radio, with the much over-hyped S350,
and they all picked up the same stations. Then, I ran across the
excellent $10 Sony ICF-S10MK2 hand-held analog-tuned radio, and found
that it gets the same stations, as the rest of the above mentioned
radios. Unlike the S350, the tuner is very tight and doesn't seem to
drift (partly because no tuning backlash). After $200 bucks, and a
year later, my digital radios are sitting on the shelf, the

now-returned S350 is probably still sitting on the shelf at RS, and my Sony sits in my pocket, ready to go. Sigh...

I went to RS today to buy a simple passive speaker for a desktop radio.
Guess what...RS doesn't carry speakers anymore (only amplified computer
speakers).
They are hopeless.
Predict they will be totally out of business within 3 yrs.

I don't understand what you mean by over complicating things.

You posited this:

> Balun = "BALanced-to-UNbalanced"
>
> Unun = "UNbalanced-to-UNbalanced"
>
> What type of antenna you are feed AND what type of feed your
> rcvr/xmitter expects SOLELY determines if you should use a balun or a
> unun ...

And I answered thusly:

That's the conventional terminology. I capitalize to make the acronym
obvious.

Five reasons I can think of to use some type of transformer.

1. Impedance transformation.

2. Matching a balanced or unbalanced antenna to the same for the feed
line used.

3. DC static electricity isolation.

4. Isolate RF ground from AC mains ground.

5. Decouple the antenna feed from the antenna so the feed does not act
as part of the antenna.

Those are five different reasons the importance of which is dependent on
the situation. In general on the subject of transformers they are all
important reasons.

Apart from the reasons for using some type of transformer you also need
to consider whether to use a voltage or current type, BALUN or UNUN, the
transformation ratio, and the disposition of grounds.

Static charge buildup in a situation is either positive or negative
depending on the charge carrier so the current is one direction or the
other as direct current DC.

That's no true. A number of people have respectfully disagreed with me
and I don't think they are Trolls. I think you are though because you
post from a free news server, are unreasonable, and argumentative.

> You know the real trolls when you see 'em, enough have bitten you on

Telamon:

There is little error in your statements, I did not disagree with any of it really.

Most here need an unun as opposed to a balun. The unun, properly constructed will take care of most of what you stated.

I simply meant most here are die hard or even casual SW listeners, they are not amateur radio operators. If someone asks or shows an interest, I like to discuss the technical details with them, let the others buy/make the device and go on about their hobby.

I was simply pointing out that most probably just view the unun as a black box, and are not interested in the technical details and easily confused by technical details they are uninterested in.

Don't be so thin skinned man, I meant no harm or I'd have picked an argument on the points I found disagreement with--and like I said, there was little wrong in your details. Common mode noise currents on coax, impedance matching, ground for static, etc.--the unun, properly constructed and implemented handles most all of it ...

Regards,
JS

You didn't answer the question why are posting from an open server.

Well how about it?

Well, if you understand what you are talking about and
if I understand what you are saying, then, No, the frame
overlapping you described (I think) is a good thing.

> Or this point holds good only with
> the desired signal frame?

Whatever transformation you apply to the desired
signal you have to apply to the corrupted signal
in the same manner.

Hard to tell from what you've been able to say.

If you do the math right (handle negative frequencies
symmetrically) then at the end the imaginary
part will be nearly zero.

That is a fair question, I will give you an honest answer from my perspective.

1) I have NEVER met a group of people so phobic, petty, paranoid, self-centered, abnormal, self-worshiping, big-headed, pig-headed, etc., etc. as amateur operators--and I post a LOT in those groups--and some read this group.

2) What I have to say can stand on its' own merits. It is either true, false, possible or impossible, or, simply an opinion of mine--who I am should have NOTHING to do with what I say.

3) Some are just here to get into personal attacks and find personality disagreements--I have little-to-no time for this.

4) The people I work for might not like me being as free, honest and NON-politically correct as I am here.

5) etc.

6) etc.

Now, any more questions? Do you understand my answer(s)? And, I am NOT asking you to agree with my reasons, my reasons are my own ...

Regards,
JS

Only if it catches on in the US. (IMHO very unlikely on AM and less
than 50/50 on FM)

They too have already committed to Eureka, though the marketplace
failure of DAB pretty much everywhere else except Britain will probably
limit rollout in Mexico.

Digital radio will surely come to be, "in what incarnation it will exist in?", that is the only question. Analog voice/music cannot even hold a candle against such a blinding difference ...

> transparent! who can explain this?

Possibly changing the thickness of the cable (via the tape) changed its
RF velocity, which may change the SWR reading. Just a guess.

Making changes to RF cables after getting your SWR where you want it
can cause changes one wouldn't expect. I shot my SWR at the tx to hell
just by cutting a few extra feet of leadin out of the coax.

JS,

- Most here need an unun as opposed to a balun.

-R- Un+Un for a 'single' element Longwire {Random Wire} Antenna.

-R- Bal+Un for a 'Two' element Dipole {Balance type} Antenna.

-=R=- And then there is . . . The Magical "MLB"
{ The Miracle in a Black Box }
MIRACLE => http://en.wikipedia.org/wiki/Miracle
BLACK BOX => http://en.wikipedia.org/wiki/Black_Box
- - - Not to be confused with "The Black Stone of Kaaba" {Mecca}
KAABA => http://www.crystalinks.com/blackstone.html
Which relates to Shortwave Listening (SWL) via VOA-News
VOA NEWS => http://www.voanews.com/english/
One of Today's HeadLines reads :
"Muslim Pilgrimage to Mecca Gets Under Way"
-by- Amin Fekrat - Washington - 27 December 2006
http://www.voanews.com/english/2006-12-27-voa47.cfm
The annual season of Hajj is now under way. Every Muslim
who is financially capable is required by the Koran, the Holy
Muslim Scripture, to make the Pilgrimage to Mecca at the
annual season of Hajj at least Once-in-the-Lifetime.

- - - Now Back To The Reply - - -

- The unun, properly constructed will take care of
most of what you stated.

-R- That is true.

- I simply meant most here are die hard or even casual
SW listeners,

-R- That is true. We are happy 'to be' what we are.

- they are not amateur radio operators.

-R- Alas that is true. But again : We are happy 'to be' what we are.

- If someone asks or shows an interest, I like to discuss
the technical details with them,

-R- Sounds Reasonable.

- let the others buy/make the device
- and go on about their hobby.

-R- A splendid Idea.

- I was simply pointing out that most probably
- just view the unun as a black box,

-R- Sometimes it see it as a few pieces of PVC
Pipe that are all glued together with a Connector
and Wire Thingy coming out of it. ;-}

- and are not interested in the technical details
- and easily confused by technical details they
- are uninterested in.

-R- Hey - You Got That Right ! - But Once Again :
We Are Happy "To Be' What We Are [.]

just your basic 'practical-minded' shortwave listener (swl)
- - - who enjoys listening to his radios ~ RHF
.
.

The need to protect your identity could be a good reason to use an open server. I can't agree with #2 however. I don't want to pay attention too people that are operating from a sphere of disillusionment and deceit. I pay attention to peoples behavior along with what they preach for example and if it doesn't jive I ignore them. Unfortunately all some people do is lie.

5295. Consider the In-the-Attic Shortwave Listeners (SWL) Loop Antenna -over- Snake-in-the-Attic Antenna

Newsgroup: rec.radio.shortwave
Date: 2006-12-28 12:13:22 UTC
From: RHF <rhf-newsgroups@pacbell.net>
Message-ID: <1167308002.542109.35600@42g2000cwt.googlegroups.com>
Source record: 101585

Mike [KA3JJZ],

Consider the In-the-Attic Shortwave Listeners (SWL) Loop Antenna
-over- Snake-in-the-Attic type of Shortwave Listeners (SWL) Antenna
http://groups.yahoo.com/group/Shortwave-SWL-Antenna/message/11800
http://groups-beta.google.com/group/rec.radio.shortwave/msg/01f4e10e7df8249c

http://groups-beta.google.com/group/rec.radio.shortwave/msg/05d50254537096a1

http://groups-beta.google.com/group/rec.radio.shortwave/msg/01f4e10e7df8249c

http://groups-beta.google.com/group/rec.radio.shortwave/msg/8678920c10cb5cc9

Grounding Blocks only work -if- they themselves are well grounded.
Otherwise they are simply a method of connecting two Coax Cables.

>From what you have written : The Snake Antenna In-the-Attic is not
your best choice; being that you are in a 3rd Floor Condo without an
effective short-path-to-ground; and "The Attic" is 'the place' you can
put your Antenna.

So some type of In-the-Attic Loop Antenna would :
* Still put you In-the-Attic.
* Give you a larger Signal Capture Area.
* Be a Balance Antenna that did in itself not require a Ground.

READ - The In-the-Attic Horizontal [Flat] Loop Antenna
Just may be the better choice to fill the available space.
http://groups.yahoo.com/group/Shortwave-SWL-Antenna/message/7144

hope this helps - iane ~ RHF

If you are going to buy a replacement for the 350, do you know what model you are likely to get? If you are "starting over", you may want to consider a model that has the capability of receiving single sideband.

> candle against such a blinding difference ...

If it does, it'll be satellite & the Internet that do it. HD can't shake a stick at the variety on satellite. (and Internet "radio" will blow satellite out of the water once wireless high-speed is sufficiently widespread) And I can't imagine paying for HD when for the same money you can get a Sirius or XM set and several months' service - and the satellite set will still work when you leave the city limits...

In my experience (yes, I *do* own a HD radio and yes, I *do* listen frequently) there is no blinding difference. By the time a station's signal is strong enough to reproduce the digital audio, it's strong enough that their *analog* is noise- and fade-free. IOW, in my experience there *is no* difference in audio quality between HD and analog.

It may be different with the European Eureka system, I've never listened to a Eureka radio. I should note that sales of this equipment have been reportedly been quite poor in every country but the UK.

Of course, those ethics may include a too liberal return policy,
so people go through a bunch of radios until they get one that
has the right feel, or people "buying" radios merely to try them
out, and then taking them back. Then Radio Shack is stuck with
radios that aren't really used, but have been out of the box.

A liberal return policy has to be made up somewhere.

No you don't. You have forgotten that the law requires your local telco to make its lines available for outside DSL providers to use. That means you have many more options than just the local guys when you want to sign up for broadband service.

In a pinch, you could sign up with direcpc and use satellite broadband the way that Markie does. He abuses these newsgroups regularly, and direcpc still lets the slime ball get away with it. Steve could never TOS you if you signed up with direcpc, whose advertising slogan is "We don't give a damn."

So stop the nonsense about having no broadband. We all know better.

Finally after many questions, much reading, and careful planning I now have completed and am listening with my new Random Wire, far end fed antenna.

It is Soooo much more quiet compared to the Windom I had in the attic. I had no reception on the 80 meter band before and now there is are many Hams yapping away. There is so many more stations I can hear now that the noise is gone.

Now listening to South Africa broadcasting around 15.24. No digital yet.

Thanks to all who advised and directed me.

Brian

Actually it is more of an inverted "L" as the the horizontal is about
85 ft and then goes about 15 ft down to about a foot above the ground
to the balun that is mount directly to the ground rod.

:) I have used his input.

At the far end the antenna wire attaches to a balun which is mounted directly to the ground rod. Then there is about 130 ft of RG-6 coax buried about 5" underground. This travels to the house to a ground block where this is another ground rod. Into the house and to the reciever.

Hope I have it covered.

What you describe sounds like an excellent basic system, and under
appropriate circumstances may be all you ever need. I hope fervently
for the day to arrive when I have need for 130 feet of buried coax!

For all practical purposes, the MLB (Magnetic Longwire Balun) is an Unun. I looked back though my posts and thought I had made reference too that, I didn't!

On my SW in the living room, I have an old ferrite rod from an am radio wound as a Unun/MLB. I have tried complex, multi-core, Unun's and although they work very well, the MLB crafted from a junk rod and wire shows little difference ...

And, remember, not ALL hams are bad, take themselves too seriously, or think their ticket is the equiv. of a doctorate degree.

I am still just a boy with a sw receiver ...

While this does not look good, I would wait to pass judgement.

Child pedo's often compromise a companies system and proxy though it to obtain their illegal smut.

While the technician did right in notifying the authorities, let the laws tech people see who was actually doing the illegal activities.

Or, simply put, just because someone parks a stolen car in front of your house, that doesn't mean YOU stole it!

Regards,
JS

5323. Re: 95% of SW stations I pick up are Christian Gospel stations

heck, you are missing all of the good stuff! you have to actually LISTEN to the gospel stations to get wacky, paranoid and offbeat! for instance check out "the power hour" on wwcr (world wide CHRISTIAN radio) for a great show! its wacky, paranoid and offbeat all at the same time! pastor pete peters of the white identity (KKK!) church goes ballistic on occasion and dr. gene scott (rest in peace) is often fascinating! you need to wade through all the chaff to get to the wheat. most people go running away if they ever even hear the name jesus. those people are missing some of the best entertainment on radio today!

I am using the LMZ-50 from RFjunkie. I would have liked to use the
LMZ-75 but he did not have anymore. So an adapter to the "F" type coax
connector and I'm in business.

I loaded a picture to alt.binaries.pictures.radio showing the direct
mount to the ground rod using 2 ground clamps. One of course is on the
rod and the other clamps onto the LMZ-50 and the adapter.
There is a spring lockwasher in between to lock them.

In science, something that is Theory has already been proven. The common
definition of theory is not the same as used in science.

What you are referring to is a hypothesis.

It is still well on its way to being proven - it has survived every
test that has been thrown at it so far. In fact, still in its
"father's" original form, it is one of the most successful theories
ever postulated.

Digital could be the future but not the schemes currently under
development. DRM on shortwave and IBOC on AMBCB both offer no
advantages to the listener. The makers of these closed systems who
are trying to supplant the current open systems have been touting the
cost savings to the broadcasters instead.

And people still do ride horses and buggies.

Not quite. In 1905 the theory was first advanced by einstein, and with it came his denial of the ether. In 1921 he found this was much too rash and stated the ether must be allowed for ... however, it will do for many things until proved correct or something else modifies or replaces it.

iBiquity's HD Radio/IBOC offers nothing but 60% the coverage of analog,
adjacent-channel interference, and extra HD channels of the same
repetitive terrestrial radio - no wonder, HD Radio is dead in the US,
DAB has failed in Canada, and DRM is struggling in the UK. The general
public is not interested in the future of terrestrial radio, but
interested in Internet Radio, call phones/streaming, WiFi and iRadio,
Satellite Radio, gaming systems, etc. There's my ignorance, asshole.

Canada tried Eureka DAB, and it hasn't gone over. The UK also uses Eureka
DAB, but is pretty much forcing it on the citizens. They keep adding more
streams and reducing the quality of each stream (it was fairly well accepted
at first, before the inclusion of more streams of lower quality). DRM is
not used for any home services that I am aware of. It is used for SW
broadcasting, and is not yet well received primarily because of lack of
receivers and the fact that most parts of the world being served by SW radio
have poor populi that couldn't afford a DRM receiver were it available to
them.
```

HD radio with drm is ridiculous. First they are going to have to lose the drm somewhere, digital rights management is a killer, it will put am stations out of business over night, they know that.

Talk radio I record quite a bit, for listening to later, with drm I would have to PAY to do that, screw that, first I will go internet or tv!

The money is just not available to go digital right now, hopefully, someone will find a way to finance that.

As for myself, I am not going to pay for anything which ends up giving me less than I bargained for, and then end up having to buy a new receiver just to get it!

DRM IS the problem! Plus, a wide-open method of encoding/decoding needs to be adopted so it will give everyone an equal footing in the digital equipment end. MP3 format is owned by a patent/copyright holder, maybe ogg-vorbis will be the final solution. Whatever, no proprietary chit should be involved.

The DRM he's referring to isn't Digital Rights Management, but Digital Radio
Mundial, a digital scheme used in SW broadcasting. The digital service used
in the UK is not DRM, but Eureka.

Radio Zimbabwe still has a pretty good signal @ 03:45 on 3.396mhz here
in Central KY. Must be well past dawn there???

Using an R71a AND A K9AY tonight.

73, Ken KG4BIG

Nice catch in Kentucky.
It's not a very easy catch here, so your K9AY must be performing very well - congratulations!

The ONLY way we will EVER get rid of Digital Rights Management is to boycott the entire entertainment industry, fight for fair use rights that have been abrogated by legislation the courts recently.

It's an outrageous question, because it's based on the assumption that
women would never be interested in shortwave listening, or amateur radio,
or any technical hobby.

Look in the history books, and there will always be some women interested
in such hobbies. And often they were stood out, not because they
were women in predominantly male hobbies, but because they were good
at the hobby.

Michael

- If it does, it'll be satellite & the Internet that do it.
- HD can't shake a stick at the variety on satellite.
- (and Internet "radio" will blow satellite out of the
- water once wireless high-speed is sufficiently widespread)
- And I can't imagine paying for HD when for the same money
- you can get a Sirius or XM set and several months' service
- and the satellite set will still work when you leave the city
limits...

Satellite and Internet Radio (Audio Programming)
-IF- You Like - What's There : Anywhere You Go - It's There !

Even Comcast and other 'land-based' local Cable TV Systems
offer Digital Music that is Commercial Free 24/7 and available
to about 85% of the Homes in the USofA.

The future of HD-Radio (IBOC) is a smaller and smaller market
composed of those who will not-adapt to newer technologies
and are increasingly getting older and dying-off - with out any
new replacements growing into the listenership.

That is outrageous!

It is based on the assumption that hundreds if not thousands of gender changing operations are performed each year. And, one never knows ...

I usually look for the adams apple (a sure indication they are male), but, the damn doctors have even figured out how to hide that!

No. My joking came only from the fact I live in Calif. and there is an abundance of fruit loops here.

Hello Mike:
I live in SF and I also have an SW7600GR (among other radios). It's possible to pick up English Deutsche Welle transmissions from Kigali here. They're not targeting North America but it comes in quite clearly here sometimes. My website often lists the shortwave stations I've been listening to, and the best antenna I have is a Degen DE31 active loop. So you will probably be able to get the same results. Good luck!

DRM was never a major part of the digital radio plan in the UK. From what I read DAB (same protocol as in Canada, different frequency band) is doing quite well in the UK; indeed, last fall at least one shop has stopped selling *analog* radios. There are plenty of ads for DAB receivers in UK ham magazines; I don't get UK newspapers/magazines so I don't know if DAB is being advertised in general-interest media but I strongly suspect it is.

That said, from what I'm reading DAB isn't doing very well anywhere else.

This evening or this morning, just 10 minutes
ago to be precise, Art made one of his trademark suprise
announcements on Coast to Coast AM.

Art is back in Pahrump NV!
He's broadcasting from there as I type this.

He's not yet back on ham radio so that may take awhile but
it appears that we soon may hear W6OBB back on the ham
bands with that BIG loop antenna soon.

Welcome back to the States Art!
We missed ya an hope to hear you on
75M during the wee hours again soon!

I wouldn't count on getting anything from Zimbo too quickly - they are utterly broke and even bread is in short supply. They haven't even got money to print passports for the locals or print their funny money banknotes on decent fraud resistant paper. Inflation is running at 1000% and it is only Red China that is offering them a bit of a lifeline so that they can import a bit of gas for their auto's.

Maybe a few US$ notes to the right person might get a QSL response..??

And if the AM/FM analog radio stations don't do something to fend off the
digital radio realm of XM, Sirius, Internet, Wireless, etc, the Feds will
also be auctioning off those frequencies.

Hi all:
Can you recomend a very good tabletop radio to buy ?
I need a radio with very good sound (bass and treble),
and I only need FM reception.
What do you think about GE superradio ?
I have a Tivoli model one radio, but I'm disappointed (excessive bass
output).
What do you think about Sony icf704L ?
http://www.comet.co.uk/cometbrowse/product.do?sku=194409&tab=specification

Thanks

I do not think I have ever logged an RRI station that is as loud as
6.125.29 is at 13:20 utc.

73, Ken

Move the Tivoli away from the wall. Otherwise, these sound very nice:

http://www.cambridgesoundworks.com/store/category.cgi?category=aud_radio&item=c173rdnb

The ''Super Radio'' is not that super.

Hello,

For FM performance only (both sound quality and reception quality) you won't go wrong with a GE Superadio (I, II, or III), especially considering the price. I own examples of all series (including both versions of Model I) and I am pleased with their FM performance.

That said, I am a bit surprised that you are not satisfied with the Tivoli Model 1. While I do not own this radio, I have heard it in several stores and it certainly sounds good to me. Before you buy another radio to replace it, try moving it to different locations, even other rooms, and see if the excessive bass output is tamed. Especially place it in the middle of your room, even though you may have no intention of putting it there permanently, and listen carefully. If, placed well away from any boundaries, the sound is much improved to your ears, you will then know that it is your placement of the radio rather than the radio itself which is causing your dissatisfaction. At that point you may be able to find a satisfactory compromise regarding positioning of the radio.

If, however, the sound is still as unsatisfactory to you, no matter where you place the radio, then it's time to buy another one.

The GE Superadio is a good one to try. (Please remember that this plastic radio is not nearly as good looking as the Tivoli. That might be a consideration for a "significant other.") I hope the above is of some use to you.

Best,

Joe

Very interesting, as I thought that right after he got married, there
were some quotes by Art posted here that his wife "had no interest in
coming to the US" and that she "never wanted to come here" [to the US].

If true, an interesting about-face.
```

I personally like my recent-model GE SuperRadio. I mainly listen to FM music on it. It has a 5" woofer & a smaller tweeter; monaural but a nice setup, I think. For 50 dollars it's pretty hard to beat. The dial is analogue, but for tuning in local stations of decent power, even on the lower end of the FM band, it does fine. Also takes an external FM antenna, if you want to connect one; I use the RShack twinlead dipole.

It's ain't a Tivoli; it's a clunky but pleasant beast :-)

Art Bell is a kook - his "young thing" wife, just married him for his money (then, surely locked it in, with having his child), and to gain US citizenship. Don't tell his wife, but Art is having sex with both and the "Greys", and the illegal types.

Canada has given up on in-dash digital radio, and is installing in-dash
Satellite Radio, instead - here is an excellent article, on digital
radio in Canada:

http://americanbandscan.blogspot.com/2006/12/digital-radio-in-canada.html

Looks like nighttime AM IBOC is dead in Canada, and IBOC is still
questionable, unless the interference issues can be resolved - LOL !

Don't buy the Grundig S350-types, Superadio-types, RS WX radios - they
all have quality-control problems, and are way over-hyped.

Last night was my first night / morning to try to pull in the Voice of Korea. However, I did not have much success due to some pretty strong interference.

I am trying to determine the source of the interference (i.e. another broadcast, or something electrical in / near my house).

I have posted a clip of the audio at:

http://mesh.typepad.com/blog/2006/12/no_success_at_f.html

Does any have any idea what the source of the interference might be? Also, is anyone in the San Francisco area able to pull in Voice of Korea at 9335 (or any other frequency)?

mike

I've managed to pull them in on 9335 a couple times (at 1300 UTC) but it always fades out on me as the sun continues to climb. And I'm in Houston with a 7600GR and about 110' of longwire on the roof. What is your setup? When I was using just the whip antenna the S/N ratio was so low that I couldn't make out anything other than the announcement that I was listening to Voice of Korea. Nothing else recognizable, but it was all just background noise.

Dave

The Boston Acoustics Recepter HD Radio has a bass EQ adjustment while its
analog Recepter equivelent does not.
I have both and they each perform excellently.

I have got about 40 feet of wire in my backyard (running up a very
steep hill). I have the same issue as you, where if I dont connect the
wire, then the signal is too low to really pick up.

Would it help if I had a longer wire?

mike

Reach 7027 up on 13927.1 kHz USB
````````````````````````````````

It is 3:33pm EST (2033z).
"Reach 7027" (Dover C-5B #87-0027) is up with Dover CP (DSN
445-4201) via phone patch on 13927.1 kHz USB (USAF MARS Operator
AFA1RE). Reports he is inbound Dover, rqsts Customs, says he has some
maintenance issues regarding avionics and radios.
Then he got a phone patch to Dover Metro (DSN 445-4175).

That file was uploaded 2/10/2006, but I've listened to Voice of Korea about two weeks ago. [Hey, it's painful to listen to that crap.]

I'll do another recording, but basically that is how it sounds. It's a reasonably strong signal in the bay area. The recording was done in the east bay.

Try your radio on Ocean Beach, Marin Headlands, etc. I think your noise is local.

The Wal Mart store I go to (one and a half miles South of doggy's couch,South is always best) has a new rinky dinky machine over there.Check it out at www.danetechnologies.com (I saw the website on the side of the machine out there in the Wal Mart parking lot this afternoon) Of course when I was heading back to my van,I just had to stop and look the machine over.I think it is the QuicKart M3 model.As I was pulling out of the parking lot,the shopping kart guy was moving that long line of shopping karts back to the store.He was at the front of the shopping karts and I saw a bright shiny handheld remote control he was holding in his left hand.Mannnn,,,, those new electric shopping kart mover machines are neat! But those cheap Wal Mart shopping karts themselves aren't worth a crap.

I'm a longtime sw listener and was surprised at the DE1102 that Santa brought our daughter for Christmas.

Such a small radio with so many features and great performance all for less than $70. Hard to believe.

China made, long term durability is unknown at this time, but I'm very impressed.

About an hour ago I caught a pirate on 6925 in AM.
Hey Joe Radio was S9+20 here in up state CT.
We had to run into town so I decided to test the laptop
Terry (r2000swler) gave me and it works great via a
dailup.

I did not know there were so many covers of "Hey Joe".

And I got to wondering, exactly who is 6925KHz assigned to?

With the limited net connectivity I have I decided just to ask
the question here and check back in few days.

Will

Possibly an Asia/Oceana broadcast.

If BBC is all you are interested in, why not just listen online?
http://www.bbc.co.uk/worldservice/

Click on Open BBC Radio Player. Let it install the WMP active X control
and listen static free 24 hours a day.

I have. We are all waiting for you to finsh High School so you can take a serious one.

> The, "Theory of Relativity" is but one example, and FAR from being
> "proven."

Since it is Theory, it has already been proven. At least, every one of it's predictions has been correct. If it had not been proven it would be called the Hypothesis of Relativity.

Since you obviously know nothing about Physics, at least learn what the terms mean.

Longer wire probably would help. I am using two twisted pairs, twisted together (old phone wire, to be more exact.) This, I believe, gives a better signal than just a single wire, but it is not that significant. Length is far more productive in my experience. One question: does your wire run by an air-conditioner or anything like that? Such a device would definetly cause noise on your antenna. I run the wire into a piece of 50 ohm coax to get it by my air conditioner, and ground that first where it comes off the roof and down to the ground and again where it goes up and into my window. Totally quiet, when overall background noise drops out enough to notice. I also inductively couple this to my whip antenna, to gain the extra boost from the preamp attached to the whip. (Have a plug that fits the external antenna jack, and clip this to some wire wrapped several times around the whip.)

If any of this helps, let me know and I will see if I can come up with anything else...

Regards,

Dave

Nonsense. The S350 is a great radio, and is outstanding for local AM and FM reception. Very drifty on shortwave of course, but is fine for locals. I have 2 - a Grundig and a Tecsun. While I wouldn't want one as my only shortwave radio, it would do fine as my only AM/FM radio, particularly considering the price and battery life.

The Chinese-made (no longer German made) S350 is cheap, low-grade
plastic, with a low-resolution display, suffers from drifting and
tuning backlash, has a smelly imitation-leather-handle, cheap
dials/switches, 1960's-grade electronics, plastic speaker grill, SW
images galore, antenna flops and doesn't snap into place, etc... Is
that enough ?

My $10 Sony ICF-S10MK2 AM/FM pocket-radio, gets the same stations, as
my now-returned S350 to crappy Radio Shack.

5441. Sony 7600GR - is it feasable to repair/replace External Power Jack

Newsgroup: rec.radio.shortwave
Date: 2006-12-30 00:24:57 UTC
From: cbx <nospam@nospam.com>
Message-ID: <a3cbp295tocnpcvr1nhultrfl68t5gv9b2@4ax.com>
Source record: 101430

The External Power Jack has developed problems after a drop with the external power plugged in. The unit will work on batteries just fine, but when you insert the power plug the little no-battery symbol appears.

Anyone price the jack from Sony (some of their replacement parts are outrageously expensive) and has anyone actually replaced the jack? I'm a technician but the eyes are getting pretty weak. I haven't even opened the case yet, just wanted to ask here to see how difficult the project might be, and the cost of the jack from Sony?

I almost always use the unit hooked to external power, thus the request.

Thanks.

Jim

It works great on NiMH cells, I use mine that way all the time.

Buy two sets of batteries and keep one set charging.

However, I resoldered the power jack in the original 7600 with
no difficulty, and I'm not a great solderer on small parts.
That may be all that's wrong.

Thanks. That is very helpful. I am new to all of this, and trying to
figure it out.

I think that most of the noise is actually coming from my house, and if
the wire picks it up, it is probably near to where ther eceiver is.

I just ran to wire high, to see if that helps, and tomorrow i am running
a new, longer length that will be even higher. If that is still noisy,
then I am going to look into running coax from the wire (connecting near
the roof), to the receiver. I need to read up on that some more.

Also, I dont have the wire grounded. I have been reading on that also,
but am not yet clear on what, if anything i actually need to do.

mike

Sorry, but you are incorrect. Article VI says that the **government**
shall not exact a religious test. Any person, company, newspaper, etc etc
can exact any test they wish. They can even measure and report a
candidate's hair if they wish.

The OP was only complaining that a certain newspaper didn't fully cover
the story or the candidate. That is a legitimate complaint if it is true.

Furthermore, many folks think that it is illegal to "discriminate" against
others. That isn't true, and isn't contained in the Constitution or any
Federal Law. What IS illegal is for the "U.S. Government" to
discriminate on certain constitutionally protected grounds, such as race,
age, gender, etc etc. While I strive not to discriminate, as an
individual (not the government) I can discriminate all day long, and not
break any law.

Well, now that we have that straight...................

--James---

Article VI of the constitution explicitly states that there shall be no
religious test for serving in Congress or the Senate.

5449. A very good tabletop radio to buy

I have both the Eton S350Dl and the Redsun RP2100. They are both
excellent radios for the money. The FM quality is very good. The SW
quality is also good. For SW there are certainly better radios. For my
serious SW listening I use my Drake R8B and my Kenwood R5000.

No. It still has great local AM/FM reception, great sound and outstanding
battery life.

You obviously had a defective unit - assuming you ever really had one at
all.

Wow. What a brilliant, incisive comment.

The point being, if all he is interested in is BBC, there is little point in buying a $500 radio. His current computer is more than enough.

Hi Ron;

Well, took the bull by the horns, and took it apart. Not hard at all to get apart, which surprised me. ANyway, found that the positive pin of the DC jack had lifted two traces from the PC board, each going to the same dual diode, D205 and D207. Could not repair the traces so put small jumpers in, and it works again..

I used a magnifier lamp and a two different sets of glasses to bring things into focus, but its back online.

Yes, the NiMH cells last a long time in the 7600, but they don't last very long at all in the DX398, it seems to use a lot more power than the 7600. I also use my 7600 in the car with a 2m mag mount antenna and cigarette lighter 6V supply, and sometimes run the audio into the tape deck, which works pretty good, but is a mess of cables.

I used to work on a ship and sometimes used the 7600 along with a laptop to receive weather maps from Boston and Hamburg using an external antenna. 7600GR is a good buy for the buck.

What brand of NiMH do you use?

Jim

Do you have the dipole, for the Receptor HD, mounted on the roof, or in the attic ? Oh boy, more HD channels of the same terrestrial radio garbage, if they can even be received. HD Radio/IBOC - a fraud and a farse !

The RS 12-150 smells of the S350 (same cheap plastic box and switches)
and has quality-control problems too:

http://www.eham.net/reviews/detail/6263

Extreme range my ass - all of the S350s, CCradios, SuperAdios are just
over-hyped, cheap plastic boxes. My $10 Sony gets the same stations as
my now-returned S350.

Hi John,

I do not send reception reports. When I was a kid I really looked
forward to the QSL's.

I also really wanted to get my 100 countries worked DXCC after I got my
amateur radio operator's ticket so I was always getting envelopes from
the FISTS club & ARRL QSL BURO.

Now I really do not care about a verification. I have nothing to prove
nor any one to impress :)

Thanks for the advice however as many that are here do seek QSL's.

...that Saddam got his neck stretched.

I'm sure he more than deserved it, but...
...what was the rush? All of a sudden. Like a bolt out of the blue.
"Saddam to die within 48 hours".

I thought that they were going to have more trials for other than just the one incident of killing the 148 in Dujail (sp?). Granted, you can only execute him once, but I thought they wanted the other trials for closure, to build an even bigger case against him, etc, etc.

Sorry, but I hope it's not deja vu all over again; the last time we rushed into something, the unintended consequences are still biting us years later.

Let's hope that none of our kids over there get killed because of this due to rioting, revenge or whatever.

Also try stuffing cotton batten into the bass porthole (if there is one). The Tivoli has been highly rated so I agree with Joe's suggestions to try things that moderate the bassiness. Alternatively, maybe trade for a Tivoli PAL or SongBook - they should not be as bassy due to smaller drivers. I'm looking at those in-store tomorrow.

I've also listened to the Boston Acoustics Recepter in-store - very impressive sound output and I understand the tuning knob can also be switched to select presets.

Just tried briefly in-home the CENTRIOS WOODEN CABINET RADIO from The Source
http://www.thesourcecc.com/estore/Product.aspx?language=en-CA&catalog=Online&category=Table+Radios&product=1219025
.
Looks like the Sangean WR-1. Also somewhat woofy and tiresome over extended listening but seemed to have excellent sensitivity and selectivity. My wife did not like its appearance in the kitchen so we have it no longer.

I wonder if Radio Shack has the same unit under its label: Hi-Fidelity Table-Top AM/FM Radio 12-204
http://www.radioshack.com/product/index.jsp?productId=2560351&cp=2032057.2032185&parentPage=family

The bands here up north seem as bad as I can ever remember. While I realize we are at a solar minimum, I sometimes seek reassurance that my antennas do indeed still work. With that in mind, I have been trying to research high latitude propagation. I do not live far from the HAARP facility in Gakona, Alaska, so I have been rooting around their website:

<http://www.haarp.alaska.edu/haarp/data.fcgi>

I find the HF waterfall plots and the ionsonde charts to be of particular interest. The HF waterfall is fairly simple to read, but I find interpreting the ionograms to be a little more challenging. I did a google search of how to read an ionogram and came up with this site which sheds a little light:

<http://www.mporzio.astro.it/CVS/index28_evA.html>

The Italian site also links to some other ionsonde facilities. I would imagine that radio users down south may not find much use for the specific HAARP data, although I would guess it might help predict over the pole paths.

I am curious how others may interpret the ionsonde data, or if anyone in the group has experience reading these charts.

Telamon, Thanks for the hint! Tonight once if got dark, the
interference started up again. I went out to the corner, and sure
enough, the light was out.

I took my radio out there, and the interference was definately from
there. Once my eyes got used to the dark, I could even faintly see the
light trying to come on (in sync with the interference).

Now I just have to figure out how to get it fixed.

thanks again...

JS - Clearly 'you' Know ChickenShit !

And the real story reads :
http://www.cnn.com/2006/POLITICS/12/29/bush.tornado.ap/index.html
CRAWFORD, Texas (AP) -- President Bush and first lady Laura Bush were
moved {by Order's of the Secret Service} to an armored vehicle on their
ranch Friday when a tornado warning was issued in central Texas, the
White House said.
http://www.cnn.com/2006/POLITICS/12/29/bush.tornado.ap/index.html
The vehicle was driven {by the Secret Service} to a tornado shelter on
the ranch at 1:30 p.m. CT, and the president, the first lady and their
two Scottish terriers, Barney and Miss Beazley, sat inside until the
weather cleared, deputy White House press secretary Scott Stanzel said.
They were never moved into the shelter {by the Secret Service} , he
said. The shelter is a few hundred yards away from the president's
house on the ranch.
http://www.cnn.com/2006/POLITICS/12/29/bush.tornado.ap/index.html
"He was in the vehicle for about 10 minutes and then he went back to
the house," Stanzel said, adding that other members of the staff at the
ranch were sheltered as well.
http://www.cnn.com/2006/POLITICS/12/29/bush.tornado.ap/index.html
About an hour later in Groesbeck, roughly 60 miles east of Crawford, a
man was killed when a tornado struck an assisted living facility for
veterans, emergency management officials said.
http://www.cnn.com/2006/POLITICS/12/29/bush.tornado.ap/index.html

A Reminder - Let us Pray for the Man who was Killed
by that very same Tornado in Crawford, TX on this day.

Remember - The US Presidency {POTUS} is Greater than
George "W" Bush -and- the Secret Service did it's Job by
Protecting The President [.]

For grounding, I bought two eight or ten foot grounding rods from Home Depot (copper coated steel with one end pointed and the other having the edges rounded off) and drove them into the gumbo we call dirt around here with a three-pound sledge (I think.) Got some grounding blocks from the local parts depot and clamped them onto the rods with clamps also from Home Depot. Fed the coax into and out of the grounding blocks so that the shield of the coax made contact with the grounding blocks. Did this where the coax came off the roof, and where it went into my window, so that the air conditioner that the coax went past didn't cause any interference, and have a nice quiet connection.

Good luck. Don't hesitate to ask if you have any questions. Someone will have the answer.

Dave

5509. Tivoli Model One - Read the Manual - It Really Helps !

Newsgroup: rec.radio.shortwave

Apogeusiste,

Plug-Up the "Base Port" located in the bottom suface
of the Radio and then give it a re-listen.
- - - Read Page #8 "Placement" in the Owners Manual.
http://www.tivoliaudio.com/files/user_guides/model_one_radio_manual.pdf

-IF- The Radio's AM & FM {Tuning} Reception is A-OK
and only the Sound is an Issue - Try a set of Powered
{Computer} Speakers. Use the "Record Out" Jack
-Note- This is a Fixed Line Level Stereo Output.

Use the Tioli Model One as the Center Independent "Base"
Speaker -and- the Two Powered {Computer} Speakers as
the separate Left and Right Speakers.

- - - Read Page # 7 "Guide to Features" [Rear Panel]
http://www.tivoliaudio.com/files/user_guides/model_one_radio_manual.pdf

read-the-manual - yes it is that simple ~ RHF

- Yes, the NiMH cells last a long time in the 7600, but they don't last
- very long at all in the DX398,

Nothing {Batteries} lasts long in the Sangean ATS-909 / RadioShack
DX-398 and in general it is best to Power it via an AC Adapter.

-Or- Get a Rechargeable 6 VDC Battery Pack and use it as
a Battery Power Source via the External 6 VDC Power Jack.

No problem. The power company in your area probably has the
responsibility to keep the lights functional. Go to their web site or
phone them with the pole number and location description to report it.
They will get around to fixing it in a few days.

SWL DX,

Shortwave {HF} Signal Splitters = Using Two Receivers with One Antenna
- - - and vice versa - - -
http://groups.yahoo.com/group/Shortwave-SWL-Antenna/message/11829

The common remedy is to use Shortwave {HF} Signal Splitters.

Here are two that are designed for the Shortwave Bands.

* RF Systems SP-1 allows Two Shortwave Radio-Receivers
to be connected to One Antenna without interaction and
with minimal signal loss.
=> http://www.universal-radio.com/catalog/preamps/1420.html
=> http://www.rf-systems.nl/pdf/sp2.pdf

* LF Engineering offers the SPL-2/75 Broadcast Two-Way
Splitter / Combiner -and- the SPL-2/50L VLF-HF Two-Way
Splitter/Combiner
=> http://www.lfengineering.com/products.htm

PLUS - DO-IT-YOURSELF PROJECT

I´m thinking to open my Tivoli and put a little tweeter to increase
treble.
What do you think ? It´s possible ? Need I put in paralel with
original speaker ?

5518. YLE Finland to cease shortwave broadcasting on Jan 1st, 2007

Newsgroup: rec.radio.shortwave
Date: 2006-12-30 11:23:11 UTC
From: Paul Dwerryhouse <paul+usenet@dwerryhouse.com.au>
Message-ID: <vpuh64-2r5.ln1@doof.home>
Source record: 101708

As of January 1st, YLE in Finland will cease broadcasting on the shortwave bands, concentrating instead on internet and satellite broadcasting.

I cannot find a direct link to the news report on their website, however this is cached in Google:

"From January,1st. a world band radio will no longer keep Finnish listeners in touch with news from home. This follows a decision taken earlier this year by YLE to close down all international short wave broadcasts in favour of internet, mobile and satellite services"

http://www.google.com/search?q=cache:ujcYlUy1Y1kJ:www.yle.fi/mobiiliuutiset/news/news_p15.html+shortwave+yle&hl=en&ct=clnk&cd=2

Last chance to catch their Latin broadcasts too, I guess:

http://www.yleradio1.fi/nuntii/id90.shtml

Cheers,

Paul

I'd like to know how widely known these stations
are in the shortwave-listening community. I've been
an on-and-off listener since childhood and have
had hams among my acquaintances, and I can't recall
hearing about the stations before reading about them
in the Post article.

A quick search of the newsgroups shows that people
were talking about them as an urban legend back in
2001.

Every shortwave listener has come across them. So they are very widly known.
Many hams listen and communicate only on their ham bands and will not encounter these stations.
I listened to them already in the early '70s when I started swl-ing

Brenda Ann,

IMHO, when a 20 year old girl marries a guy that she's only seen in person for a few weeks, a possibly rich (by Filipino standards) and certainly famous guy, and that guy is old enough to be her *GRANDFATHER*, I may be cynical, but the phrase "Gold digger" has to cross your mind.

Keeping that phrase in mind, at the time, I was surprised when it was said that she didn't want to come to this country--but she got here soon enough anyway.

However, your weather explanation is interesting and could affect decisions on where to live.

I'm getting an interesting show on 2305. It's usually two men on a radio show talking to each other. I believe that one is calling the other on a phone line. They usually speak about how things are going to get worse in the upcoming year, with more tornadoes, heat waves and other calamaties. Has anyone else heard it?

I think I have heard more in Spanish than English. But yes, I've heard
them for years also.

Maybe you and Carter should have offered Saddam sanctuary in your
homes. You both seem to love him sooo much.

Any chance to catch them in Eastern US today?

I've checked Passport and primetimeshortwave, but no listings.

I did hear Fiinnish conversation on the broadcast bands (can't remember the
freq.) several days ago, sounded like a casual interview and then
disappeared at the top of the hour rather abruptly.

Try listening to 3.215mhz instead and you may hear the same thing. It could be an 'image' of the 3.215mhz transmission. They are very strong into the northeast at night.
Good Luck

You ever heard of tone controls? Anything purporting to be "Hi Fi" needs a minimum of a single tone control, but preferably separate Bass and Treble. Not everyone's hearing is the same, and different programs require different settings (speech, orchestra, rock).

Thanks for the tips. I dl'd the cookbook and signed up on the Yahoo groups site.

I've found out over the past day that the fold out stand on the back of the radio is rather fragile and is showing plastic stress already.

Kaito are now offering the Redsun RP 2100 as the Kaito KA2100
see
http://www.kaitousa.com/KA2100.htm
Selling for $130

I have the RP2100 since August and highly recommend this radio for super
sound and very sensitive to weak signals on FM and MW
Great performer on SW as well. Solid, robust and well built

(Heads up thanks to Eric Weatherall, CA and DXinfo website)

There is LITTLE DOUBT in my mind that Saddam's hanging video
will be aired on Al Jazeera, Al Arabia or one of the other minor
raghead
TV Networks VERY soon (..prolly after this weekend as it's some kind
of an Islamic holiday) and when it does you can be sure it will be up
on ogrish.com and posted all over YouTube in the same hour with
a link on that shi+stain Drudge's page as well. No doubts whatsoever.
Just wait for it.

Alternate to above perhaps is BBC World b'csting
Saddam-on-a-rope just to get a leg up (..as usual)
on pathetic Chicken Noodle News and
it's illegitimate cousin, the FAUX Network.

Kloss was known, among other things, for minimalism. Tone controls are not part of that program. And given the size of the panel, a tone control may would have disrupted the clean lines, while making the panel more busy than it needed to be.

All of which is a matter of taste.

However, your assertion that 'anything purporting to be "Hi Fi" needs a minimum of a single tone control," flies in the face of high end design, where the most expensive, and highest performance hardware have no tone controls or spectral contouring circuitry at all.

That said, there are simple ways to mitigate undesireable bass content.

One of the simplest ways to control the bass perception of Model One is to place the radio on a sound absorbant pad (one that extends several inches from the front sides and back of the set) on a table at least one foot from a barrier--a wall, or other raised vertical surface.

Minor mitigation of the boom (the offensive part of the bass response) without reducing bass perception can be achieved by setting the radio flush with the edge of a table about a foot from a barrier.

You'd be surprised at how much tone control you actually have, by varying the staging of the set.

Great. So to make up for the poor design, you can't place it wherever you
want to. It has to be on a special pad at precise distances from other
objects.

Yeah, that's what I want.

Mike

Hello Brian,

I would also keep my eye out for either the Drake SW1 or SW2. The SW2 will most likely be over $150, but you might get lucky. The SW1 seems equivalent to the DX-394; although it may have less features, it's quality will be above the Realistic's.

Might be better to just save up a bit more and go for something better?

Good luck, and let us know what you end up with.

5565. Dimmer Switches

Newsgroup: rec.radio.shortwave
Date: 2006-12-30 17:31:17 UTC
From: CelticDude <CelticDude2006@gmail.com>
Message-ID: <1167499877.694581.256350@k21g2000cwa.googlegroups.com>
Source record: 101754

Hello all,

My wife seems to be using the dimmer switch more in the winter just when I'm listening to SW. The noise blanker doesn't seem to help. Are there dimmer switches made that don't produce the "pleasant" buzz of the standard one? Presumably it would be more expensive, but might be worth it.

Thanks,

DWP

5566. Is it true the Eton E1 uses the whip for an AM Antenna?

Source record: 101755

Hi I remember reading in the radiointel review that the E1 does not have a built- in ferrite AM antenna. However, I've read in this group that the E1 uses the whip antenna for AM reception, much like a car radio. Is this true? How is the MW reception on the E1 without an optional external antenna?

Yes, they will be marked "Includes radio frequency interference
suppression circuitry" or similar.

> Presumably it would be more expensive,

Yes

I would say that, although it is not quite a DX machine for MW, it is
still respectable with the whip.

Hey, Physics is a bitch, what can I tell you.

Now, you don't have to do any of these. And thousands of users don't find any objections to the Kloss design, and enjoy the radio as is daily. I do so, myself.

But if, as some do, you would like to reshape the audio to your specific tastes, you have options.

You may exercise them, or not, at your discretion.

But bitching doesn't really contour the bass, now does it.

I'd suspect you may be happier with a different set.

Thank God for the free marketplace that will accomodate your preferences.

Good listening to you.

Did you ever hear of this group called the Secret Service??? Maybe you
have lived under a rock for a long time.. It is the sole responsibility of the Pres.
Secret Service gaurds to keep him safe under any and all situations. The Pres.
has no choice in doing what they say. If "any" threat pops up they will take
him to somewhere where it is safe whether the Pres. wants to or not. They will
drag him kicking and screaming if necessary. Thats their job. And you are
still a MORON, for not knowing this. The last Pres. that went against the
wishes of the SS was JFK, and you do know what happened to him right??
Since then the Pres. does what the SS says. period.

Everybody with a computer and Internet connection knows about radio
stations that stream. This technology just like radio has its drawbacks
ranging from sound quality to availability so no way in hell are you
going to convince a NORMAL THINKING INDIVIDUAL that Internet streaming
technology is BETTER.

I have listen to it and it sounds like crap. I do not think I am alone
in thinking that listening to low bit rate audio is tiring on the ears.
You must like all your pictures in low resolution too.

The upscale Lutron dimmers are pretty good (around $30) Diva or better, with more RFI suppression than usual.

I buy them for neighbors. In your own house, they're still audible but not nearly as bad as the economy dimmers.

Replace the dimmer with an on/off switch. It's cheap and 100%
effective. Then find a bulb with the right brightness.

I have not looked for them but they used to have bulbs with three
wattage setting and a extra contact in the base requiring the right
type of lamp. Three choices should be all she needs.

The Equipment tag on that film
indicates the same camera used here for
Saddam's hanging as also used
during two out of three of those
phony head chopping videos
shown earlier this year.

The Russian neck chopping video
was real.

And now this just in.

Interesting! Didn't know Lutron had an upscale ($30) version. The Lutron
I am waiting to put in was 15 bucks at Home Depot, about triple the cost
of the cheapies they sell.

5596. Re: Is it true the Eton E1 uses the whip for an AM Antenna?

It is very sensitive on MW with the whip......but.....the whip has little immunity to locally generated noise sources within my household. I cannot rotate it to reject a noise source as compared to a radio with a ferrite rod.

There is no issue with lack of sensitivity...but there will be more noise with that signal as compared to a set with a ferrite.

I'm a casual listener-- mainly english international news such as China Radio International, etc., but i'm just getting started and dig the hobby. i am aware all this stuff is on the web but i like tuning it in on the radio-- there is just no substitute for that imo.

Which of the following would you recommend:

eton e1
sony 7600gr
sony icf-sw07

i know there are big price differences -- i'm wondering if the e1 is worth the extra money for the type of listening i do. sw07 is very gizmo-ish. 7600gr gets nothing but praise.

what do you think? thanks.

'''
''''''''''''''
The problem with shortwave listening is that there is not much left to
listen to. Most of the big international broadcasters have shut down
their tranmitters and moved program delivery to the internet or
satellite. Radio Finland is this week's loss. There are a few still on
the air, like Radio Canada International, producing good programs, but
they are on tight budgets and restricted schedules.
There are over a thousand people registered to this website, and
many of them are new and want to actually listen to something on their
new portable sw radios. They want to hear different points of view from
foreign locales but all they get on their radios are preachers asking
for support (money). By the time they can spell Walterboro, they are
discouraged at their inability to hear on shortwave the programs that
have moved to the internet.
One type of shortwave hobbyist is not paticularly interested in
programs but specializes in ferreting out weak and distant stations.
The weak broadcast from Ulan Bator or the 50-watt rebel transmitter in
deepest Africa are his targets. This specialty requires excellent
receivers and big antennas. The fact that the programs are not in
English is irrelevant, since the competition of the country count is
the thing.
Unfortunately, we are at the bottom of the sunspot 11-year cycle so
short-wave reception is at its worst and it will be a few years before
conditions improve. By then, at the current rate of loss of stations on
shortwave, there will be nothing left except preachers and weak
remotes that will need top-end equipment that most people will not want
to buy.
I think we are in a transitional phase. The rapid growth of
internet-based radio plus the advances in cell technology will produce
a portable cell phone radio that will combine many functions including

streamed programs from foreign countries. In fact, you can do this now if you have a newer cell phone and are near a cell. You can listen to the bbc right now as if you had a portable radio...actually you do. When this happy day arrives, rec.radio.shortwave will revert to dx chasing only and the 10 denizens will no longer be bothered by people who want to listen to programs.

I agree that 8k internet audio is poor quality but I find the 20k bbc
feed much easier on the ears than any shortwave program I hear. Also,
technology moves on; and there are lots of 100 k or better internet
sites now that are fm quality and the audio quality of all sites will
soon surpass that of any shortwave broadcst. For a look at the future,
visit the Internet 2 site.

The guy a Trolling idiot. Ignore him. There are to many stations to keep
track of. Some stations come and go on the air.

You want to hear more buy the Eton E1.

You need portability buy the Sony 7600GR.

bbc America is only a tiny slice of what is available on the bbc. They
have seven streams of live programs plus hundreds of archived programs.
They cover such areas as comedy, plays, classical music, literature,
pop music, documentaries, history, archeology and so forth. This range
of progams woule be impossible to provide on a one-channel shortwave
station

It sounds better than any shortwave radio. 20K speech is not low bitrate
audio. Fading, static and interference on shortwave is tiring on the ears.

Dumb question, do the dimmer contraptions make noise only when a light
is on, being dimmed, or do they also produce noise when the light is
off and/or not being dimmed.

I've got a few old dimmers that came with the house, and this may be
one of my noise sources.

For sheer bang for the buck it's hard to beat the 7600gr. It has no tuning knob however, so you can't just "spin the knob to see what's on".

You might also consider the Grundig Satellit 800. Can be had for around $350, they regularly turn up on eBay. Good sound, great synch detector, and a tuning knob. I have one (along with many many other radios), and it's generally my most-used radio.

If you can afford a Satellit 800, get a E1 instead. It is smaller, more
advanced, very sensitive and selective, and a sheer pleasure to use. It
can also be used for XM listening with the additional ant/recvr. It can
be found for about $350 if you look around.

Best,
-Al

You are typical of other anti-Bush/anti-Iraq-war folks. You have a
highly idealistic view of the world and politics/war. Time to start being
realistic.

Generally, only when the light is being dimmed. The better switches
have a detent for full on and full off, thus bypassing the dimming
circuitry. They typically use a thyristor or SCR for the dimming
function and it works by varying the width (chopping off) part of the
sine wave. As you get away from the pure sine wave (full on/no dimming),
the waveform becomes more and more distorted and causes the interference.
>
> I've got a few old dimmers that came with the house, and this may be
> one of my noise sources.

There is a very good chance of that being a true statement. Easy enough
to check by just turning them all the way off and see if the noise goes
away.

Good luck and HNY...

The mini-stand is only good for the tiniest of radios, like the little one pictured in the link to stand with radio. Notice that the small stand has a little curved base for the radio to rest on. You'll be happier with a large stand I think.

It just came in the mail today. Audio performance is similar to the Lowe receivers. MW/LW performance is a little bit more sensitive than the Grundig Satellit 650.
It needs some cleaning of controls/switches, but overall it is in good condition. If you find one of these, make sure that you get it with the optional ADF antenna. I believe that this is required to make it work.

No, the included dipole is mounted on the wall right next to the radio.
You would need an antenna on any radio trying to pick-up any signal that is
1/100th the power level of the main carrier (IBOC) - you nitwit. You seem
to
constantly and conveniently omit this important fact about IBOC in your
propaganda.

> Oh boy, more HD channels of the same terrestrial radio
> garbage, if they can even be received.

Far better than the garbage on shortwave.

> HD Radio/IBOC - a fraud and a farse !

A fraud and a farce in your own mind.

You may think it is "gizmo-ish" but if I had a choice of your three picks I would take the SW07.
Why? Because I own one and the SW07 version of the Sony sych-detector is superior to ANY portable/luggable SW radio ever built - period.

> 7600gr gets nothing but praise.

Indeed because the price//performance/value factor is excellent.
And it also has a synch-detector but not as good as the SW07.

Absolutely unbelievable, for a radio in this price class without an
internal ferrite-bar antenna, and without a Satellite Radio antenna,
too ! God, pay $400 - $500 for another Eaton Shit receiver, with a
plastic housing and cheap plastic knobs, and add on another $100 for
the extra antennas ! Jesus !

5645. Re: Is there a better desktop SW reciever under than $150 than the DX-394?

Newsgroup: rec.radio.shortwave
Date: 2006-12-31 00:19:09 UTC
From: Pete KE9OA <p.gianako@comcast.net>
Message-ID: <IfSdnQzJpe1hnArYnZ2dnUVZ_qCmnZ2d@comcast.com>
Source record: 101884

the SW-2 is a pretty good receiver, but the SW-1 uses an NE-602 as the first mixer, which has poor dynamic range. The problem is compounded by the fact that there is no input bandpass filtering ahead of the 602.
The DX-394 isn't a bad receiver, but it has a simple LC circuit for the input filters. When I say simple, I mean that there is one RF transformer and one capacitor that is tuned to the center of its tuning range. This topology gives very poor out of band rejection since the filter curve will be that of only a single tuned circuit. Still, the receiver doesn't work too badly.
The longwire antenna input is somewhat of a joke with the 394.....it bypasses the front end filters and applies the signal directly to the input of the 1st mixer.
If you can find one in the 100 to 125 dollar range, it isn't a bad deal. Radio Shack was closing them out a few years back for the 150 to 170 dollar range. That was a good price for a brand new unit.
The problem in buying a modified one is the mystery in who did the mods in the first place. I have run into some pretty butchered up radios over the years, and it took quite a bit of work to undo the changes.
Just make sure you know the technical ability level of the person who did the mods. If they were done by somebody like Craig, over at Kiwa, then you know that the workmanship will be good.
Good luck!

Pete

Earlier Radio Bunny was on this freq in FM.

>From about 23:00 to 00:00 there were several very weak, as
lost in the noise, SSB signals.

And last night there was a odd job Radio Joe that played every
cover version of "Hey Joe" known to man. A very strong signal

Looking at the <http://www.ips.gov.au/HF_Systems/4/3> our MUF,
I am in Lexington KY, is 4 down from 5MHz an hour ago. And I bet
that by 01:30 it will be down to 3MHz.

I have very little flutter or fade and I suspect I might be getting a
good
ground wave signal. Anyone know where this station originates?

Terry

Good grief! You are such a naysayer. The truth is that this receiver is
at LEAST as good as the 2010, Sat800, and anything else out there in the
portable family. Why are you on such a mission to speak ill of this radio?

Give it a rest and gfy.

I'd recommend using it with an external antenna. If you buy the E1 from Universal Radio, they give you a free Grundig G-4000 portable that you can probably sell for about $100. they also have the antenna adapters for hooking up whatever external antenna you want. I even think I heard a claim that Eton might provide you with an antenna adapter, maybe free.

I use a Radio shack loop (discontinued) that is the same as the terk AM advantage antenna that sells for about $50. this gets me some reception some nights on MW/AM from Europe, Africa & the Middle East.

Yes, they made a mistake with the antenna connector. But it's still considered the best portable ever made. George S., MN

Maybe it's late at night. Maybe in the middle of the day with a cup of tea. I'll catch a good DX station and hear something human: two people talking or perhaps a radio host taking calls from listeners. They could be talking politics or horror movies. I love listening to radio. Will it last? There's nothing like a good radio and all the entertainment available on the airwaves.

Hopefully, nighttime AM DXing will be around for a while (atleast, it looks that way in Canada), if HD Radio/IBOC is not approved for nighttime (HD Radio will fail, anyway). Sometimes, I also listen to Internet Radio, while I look at porn.

I finally could access the full vid on LiveLeak:
http://www.liveleak.com/view?i=863ce7d4a3&o=1
The drop comes at 1:39.

The quality is for crap, but that's because it apparently was taken
with a cell phone video. They do show a couple of quick frames of
Saddam, still in the noose, after the fall.

Yippee!

I own a Degen 1103 and use the antenna whip and I have not strung out an alligator clip with longwire yet.
It seems a bit deaf with the antenna on the 80 meter ham SSB band Anyone compared the Degen 1103 with the whip versus outside longwire? I live in a large house in a town that definately picks up much electrical noise using radios. I know this as I use to live in a mobile home in a rural area and the electrical noice level was lower. Back then, I use to have a DX-440 and used a 80 foot longwire on the roof with alligator clip and got some very impressive results. I just got back in to some SW listening after a 4-5 years limited use, so I am wondering if going back to a longwire with the Degen 1103 with make a difference (of course if I can get past the house electrical field/noise issues).

Honestly I find the E1 to be a very solid radio! It weighs a ton and has
a very utilitarian feel to it. The knobs have ZERO wobble or play in
them, the display is immaculate, the whip is beefy and sturdy, the
sync detector is very quick and effective, etc.... what more do you want
other than the ferrite bar?

> old dimmer switch days.

Usually if the dimmer switch is off or fully on it does not make much
noise. Why you ask? They way they work is to switch a portion of the 60
Hz cycle on and off to the light. When very dim the switching device is
off most of the cycle and is on more of every cycle as you cause the
control to brighten the light. When full on the switching device is on
all the time and when the control is fully off the switching device is
off all the time. It is only when it is between the two extremes that
the switching device turns on and off every 60 Hz cycle. It is that
switching that generates the pulse noise. This square wave pulse noise
is very broadband in nature being composed of many frequencies.

I don't own one but the specifications sure look good and people that
seem to be normal folk that post here are happy with it.

So true. I keep running into idiots who are NON-conspiracy believers.

However, everyday I get up I conspire to get the best parking spaces, cheapest meals and goods. I conspire to make my boss want to give me a raise. I run conspiracies attempting to impress beautiful females. I conspire to pay the least possible taxes. I conspire to make some of my neighbors think I love them--even though I hate 'em!--well, hate is a bit overstating. ...

The list is endless, and of course, some things I conspire on cannot even be mentioned, and certainly not here.

Regards,
JS

It appears that you don't need the loop antenna with this unit, unless you want to use it in the ADF mode. With a long wire hooked up to the external antenna input, there is no sign of IMD, or any images. I saw two crystals on the main board, so it may be a dual conversion unit.....I am not sure yet. I e-mailed David Searle to find out a bit more info. It should prove interesting.
It is one of the best LW/MW receivers I have seen in a long time.

Pete

The E1, only "weighs a ton", after you have stuffed all those damn batteries into it - just like the cheapo S350. Tecsun/Eton/Grundig - "made with slave wages in China" ! I And yes, the cheapo plastic knobs wobble !

I smell a happy marriage with a baby on the way.

You can't get setup up in a marriage. This is two people agreeing to
spend the rest of their lives together. I guess our society is so
screwed up people see this as something else now. Everything is done
for some kind of advantage over another like a Ron L. Hubbard's novel.

I'd vote for the Sony 7600GR on the grounds that it offers the most
bang for the buck. In the meantime, if you want to listen to CRI, you
probably just need to position your head correctly in order to hear it
through the fillings in your teeth--probably on multiple frequencies!

A little joke there...CRI drives me nuts.

All these radios are being made and most likely designed overseas.

In the software industry, foreign engineers can be had for $10,000 USD a year or less and they think that is a good wage in their country. Factory workers in china consider $3.00 USD a day a good wage.

Now, when they take this cheap chit, chuck it in a plastic case and build it in a way where it is lucky to escape its first fall on a hard surface ... over $100.00 USD and I would tell 'em to keep it.

I don't think the youngsters know any different, they were born during the time throw-away-junk was becoming all which is obtainable.

Now don't get me wrong, I have a nice receiver, a boat anchor from a bygone day. The rest is just cheap plastic chit :(

I doubt if you can find any radio which is still manufactured in the USA--toss the boards into cases and claim "assembled in the usa" or some such nonsense though ...

Regards,
JS

HI Snow, all,
I use the '1103' on my 130ft 'Doublet' aerial and with the attenuator in circuit (don't try your radio with out the att in circuit by the way on ANY external aerial) and it receives all the signals I hear on my more elaborate equipment with the same aerial, and no break-through into the IF stages. For me (my opinion only) the '1103' is the best portable I have ever used for SSB listening and Short Wave in general on an external aerial.....Good Luck, Ken, G4KIR.

That wasn't an execution video, you fucking moron.

That was the shit they played on the local news.

When somebody gets hung his entire tounge protudes from his mouth. and if they are dropped far enough, they don't kick much. A good camera man will focus on all the piss and shit that runs out of them.

They give a few good kicks and shit themselves.

Dispicable suburban mommy boys like you and Drudge should be the next motherfuckers getting hanged, and don't rule it out. I prefer the lined up and shot, because there is more blood, and the expressions are way better when you get your punk ass riddled with lead.

They all look so surprised, and the spewing chest and barfing blood has it all over getting hanged and the toungue and shit rolling down.

People have forgotten how to kill.

The Japs had this EXCELLENT death torture where they boiled you to death slowly, and while listening to the screams they were serviced by prositutes.

That's class.

Will It Ever End . . .

Somewhere some how RFJunkie has found another one of
his LMZ-75 type Longwire Antenna Impedance Matchers
with the 75 Ohm "F" Connector.

This appears to be an early model of the LMZ-75
Longwire Antenna Impedance Matcher
http://cgi.ebay.com/Shortwave-Antenna-Longwire-Transformer-Balun-F-conn_W0QQitemZ150076277
164

http://cgi.ebay.com/_W0QQitemZ150076277164

FWIW - Recently a 'used' pair of RF Junkie's Matching
Transformers sold on eBay for $42+$15S&H.

that's all folks ~ RHF

Source record: 101813

DoN.

So does your Car Radio have a built-in Ferrite Rod
Antenna for AM/MW Reception - - - NO !
http://groups.yahoo.com/group/ETON-E1-XM-Radio/message/3758
- - - But many AM/MW Radio Listener's wish that their
home radios could receive the AM/MW Band as well
as their Car Radios.

While a Whip Antenna used for AM/MW Radio reception
lacks the directional characteristics of a AM/MW Ferrite
Rod Antenna : When fully extended a Whip Antenna can
have a Greater Signal Capture Area then Ferrite Rod Antenna.
http://www.etoncorp.com/US/resources/manuals/E1XM_US_693.pdf

A Whip Antenna with the proper Matching Circuit for AM/MW
Radio Reception an be a very good Antenna for a portable
AM/FM Shortwave Radio.
http://www.etoncorp.com/US/resources/manuals/E1XM_US_693.pdf

IIRC - The Eton's built-in Whip Antenna can function as
an Active Antenna for both Shortwave and AM/MW Radio.
The "DX" Control {Antenna RF Signal Amplifier} can be
used with the Whip Antenna for better AM/MW Reception.
http://www.etoncorp.com/US/resources/manuals/E1XM_US_693.pdf

The Whip Antenna can be fully extended and layed down
Flat {Horizontal} and then Rotated to help improve it's
directionality to Peak and Null an AM/MW Radio signal.
http://www.etoncorp.com/US/resources/manuals/E1XM_US_693.pdf

While the Eton E1 Radio does not have a built-in Ferrite Rod
Antenna. Its AM/MW performance Off-the-Whip is every-bit
as good {if not better then} as the Sangean ATS-909, Sony
ICF-SW7600GR and Grundig 4000A radios using just their
built-in Ferrite Rod Antennas. It may fall behind the GE
Superadios; Grundig S350; Redsun RP2100 and CC Radio
but each of them has large Ferrite Rod Antennas that are
usually not found in most 'portable' AM/MW Shortwave
Radios.
http://www.etoncorp.com/US/resources/manuals/E1XM_US_693.pdf

Don't short-change the Eton E1 Radio : It has very good
AM/MW Radio reception using the Whip Antenna.
http://www.etoncorp.com/US/resources/manuals/E1XM_US_693.pdf

Periodic noise, that's noise spaced every few kilohertz is probably a
TV, maybe a plasma TV.

> what do you think? thanks.

Tom K-in-LA,

My 'choice' would be the Eton E1 simply because it is the
better Radio and has the Larger Speaker for a Fuller More
Natural Sound all around the room for Hours of Radio
Listening and Enjoyment.

Not on your list but also worth considering is the Grundig
Satellit 800 Radio. Again it is a better Main Home Radio
for the Casual Listener.

Grundig Satellit 800 Millennium Shortwave Radio
http://www.amazon.com/Grundig-Satellit-Millennium-Shortwave-Radio/dp/B00006I5AF/

If I were looking for a Kitchen Radio or Home Office Radio
it would be the Grundig Satellit 800 Receiver.

If - I were looking for a Bedside Radio - It would be the
Eton E1 Receiver.

The Sony ICF-SW07 might make a nice Desk-Top Radio
but I think that it would wear-on-the-ears as the listening
hours increased.

The Sony ICF-SW7600GR is a good Radio but for use as
a Main Home Radio for the Casual Listener : It would need
a Pair of Powered Speakers to give it that room filling sound
and make it an Hour-on-Hour Listening Radio.

OBTW - I do have three Grundig Satellit 800 Radios
up here in Twain Harte, CA :
* One in the Kitchen - Beautiful Music on KMPH 840 kHz Modesto, CA
* One in the Home Office - News on KCBS 740 kHz SF BayArea, CA
* One Bedside - Classical Music on KXSR 91.7 MHz Groveland CA
and any thing else that is 'out-there' On-the-Air Late-at-Night !
Plus another one in the Kitchen down in Oakland, CA.

The Grundig Satellit 800s are each Wonderful Radios to
Listen to as a Main Home Radio for the Casual Radio
Listener in any room.

radios - it's all about listening and enjoyment ~ RHF

I went to the page and I don't see them on 2305 KHz. Lowest frequency
they broadcast on is 3215/3210 KHz.

I found a very good site about radios (www.eham.net), and there is a
very good review about Tivoli model one there:

"The issue I have is that many of the commercial stations (all playing
music I don't want to hear-but you might) around here pump up the audio
and boost the bass in the transmission process, this excessive bass
boost by the station added to the bass boost included in the radio to
offset the tiny speaker can make the radio sound boomy and tubby with
distorted lows, and there aren't any tone controls to fix this."

I listened to 3.215 and 2.305 which was a much weaker signal and the
broadcasts were the same.

I heard the call letters on the 3.215 freq.

They at 10:00 UTC they logged off 3.215 and advised listeners to change
to 9.985.

I don't understand the 2.305 signal.

It's a constant buzz from the bottom of the BCB to 40 meters. I
get the same buzz when the dimmer on my halogen lamp is being used. Its
so strong that my loop antenna wont null it out.

My guess is that someone just hacked their site. At first I thought
that'd be pretty funny, but then it occurred to me that some aspects of
it might not be so funny. The people in power over there are so crazy
that something like this could get a whole lot of people killed. Let's
put it this way: I'd hate to be VOK's webmaster this morning....

Telamon wrote:

> I smell a happy marriage with a baby on the way.
>
> You can't get setup up in a marriage.

Au contraire. It happens all the time. You must have led a -very-
sheltered life if you have never heard of women purposely getting
pregnant to force a man into marriage (although not applicable in this
case).

I would politely suggest you look at the facts:

1) His (second?) wife's body had barely assumed room temperature before
they got married.

2) He was distraught over her death, possibly not thinking too clearly.

3) I'm sure it was a play to his ego that a 20 year old was 'interested'
in him (little head thinking for big head?)

> This is two people agreeing to
> spend the rest of their lives together.

Yes, exactly the point! But don't you think it a wee bit suspicious that
they are going to "spend the *rest of their lives* together" based on
knowing each other in person for only a few weeks?

I truly wish them the best, but I'm sorry, but it just has -all- the
hallmarks of a green card/gold digger job.

P.S. I felt this way when I first heard of the situation, but the
statement at the time that "she doesn't want to/has no interest in going
to the USA" held me back. Well, that "no USA" didn't last very long, did it?

I have taken the SW07 around the world. I let my non-technical
brother-in-law use it overseas.
I myself take good care of a jewel like my SW07 as well as my SW100. The
SW07 seems less rugged than the SW100. But you wouldn't want to perform a
drop test with any portable. Neither radio has developed any type of defect
in either cosmetics or performance.

I have owned both for about 2.5 years. The ergonomics of the SW07 w/AN-LP2
is pure pleasure. Of course the tiny speaker, as in most all portables, is
a negative. But I use these two miniature portables with a good set of
headphones. BTW, the SW100 is hailed by audiophiles to have superb FM
audio.

Both radios are getting hard to find and each have held up very well in the
resale market.

If you want one get one now.

Ah yes, so young and so nice. I spent quite a bit of time in the China
sea area myself. 'Underway for Subic Bay' was our war cry. I was just
a young pollywog - not even old enough to have a drink with Capt'n
Morgan in Pearl - when I set sail. I returned a man, a shellback, a
salty old sea dog was me. Some of those girls were so young we'ed a
been thrown in jail in the USA for what we did to them. Thank Neptunes
Rex for giving us an Island full of those 'young things' but this is
not the place to spin a tale of the lustful drunkin was of a wayward
sailor so I refrain and wish all who gather here a happy 07.

>

Your off the mark here. Way off. I've used both radio's side by side with the same antenna. The R75 is a better DX'ing radio. Better for utility and better for DX'ing. The people that dispute this are "fans" of the Drake radios. Key word here "fans". Like a person who keeps going to see Boston loose to NY. The keep loosing, but they still love thier team. Also.... Your statement "Some of the top DXer's in the world use R8A/B's" further demonstrates just how far off the mark you are. If a "Top" DX'er or a professional with a job to do selected his gear, it wouldent be an R8 series. He'd pick one of his WJ's off the rack. At the very least, he'd take an ICOM 746Pro or somthing at least as capable. While your contemplating your next post, put "Take Me Out To the Ball Game" in your CD player and have yourself a hot dog.

Michael

Here ! Here ! She married him for US citizenship, and now has locked in his money with a baby. Even with a prenup, with a baby, she could have reason to fight it - if she gets divorced, Art and his estate, will be supporting her forever (she can always claim hardship). Art is a total idiot, that let his pecker do the talking - well, if you are tapping something, many years your junior, we all know, how we can lose our heads. He is probably already sick of tapping her, especially now, that her body is all worn and stretched out.

Cuhulin,

The kinds of neighbors who have light dimmers, TV sets, Microwave ovens, electric shavers, computers and on and on and on and on and on. The problem is that they are all compacted into one place and right on top of me. I can only hang antenna in apartment so I'm sure SWL will be useless. There is an antenna farm on top of my new employer's building that would make anybody here drool I'm sure, but I doubt my boss is going to let me hook up my radios to his antennas. There might be a hamshack in the place somewhere so I'll have to ask. Anyway that 590A is looking like it might happen.

Neo-Kommie Liberals intend to curtail your ability to discriminate by distorting and withholding facts.

Where ya been friend. I think Boston beat the Evil Empire a year ago
and went on to win the World Series. As I recall the Red Sox may have
been down 3 games and won 4 in a row as well.

"Interesting" was the better choice. No question you'll get conditions that your R8b's synch wont help with. If you spend any time at all listening to SW, you'd learn that your first day on the dial. Not to mention, you'll find all kinds of over or undermodulated broadcasts. And plenty of them with too much bottom or too much top. If you spent a day in your life listening, you'd know that. No matter how slick your R8b sounds listening to a clean broadcast or one with a minimal amount of distortion or intermod, most of what is out there sounds far from desirable given the nature of sw. Using your sound card and a full software equalizer and effects set up on your PC to mix signals is not only an outstanding tool, once you've gotten good with it, you'd consider it to be an essential part of your sw listening gear. You would really be amazed at what you could do just by rolling over or boosting part of the audio. That doesn't even include things like reverb or audio level clipping. I'm astounded that it hasn't become the norm.

I recall a great bit by Johnny Carson years ago. He had Jane Fonda (I think) as a a guest who had brought along her cat which was sitting on her lap.

Fonda said, "Do you want to play with my pussy?"
Carson said, "Sure, but first you'll have to get rid of your cat."

And somehow they got it past the censor---something like the Fugawi indians.

Good suggestion -- my Sony 2010, tuned to about 800 kHz, picks up a
good buzz on my dining room dimmer, and also on my energy-saving
flourescent lights -- maybe I need to re-think all of the
flourescents. The dimmer buzzes only when in use, so that's not so
bad.

A large plastic pistol case from Wal-Mart or other retailer might be a good choice. Most are foam lined and well padded. Usually cost under 10 bucks.

Hello Mike,

I found a small laptop case at Target for mine. Has an extra pocket or two, which is nice. Relatively inexpensive - around $17. The AC adaptor fits awkwardly, but not too bad.

It was a direction finder that tuned 150 to 400kHz, 535 to 1650kHz, and 1.6 to 4.0MHz.
I received an e-mail from Mr. David Searle this morning. It is a single conversion unit with 3-gang tuning. A Philips TDA1083 is used as the I.F. subsystem. It looks like it uses the same LCD that the Lowe HF-150 uses. It uses a hand held DF antenna that has an illuminated compass for taking bearings. The unit is quite sensitive, comparable to the King KR-85 radios that you find in the smaller airplanes.
Lokata was a company in England that started in the late 70s. Nice equipment.

We're raising a whole generation of kids to whom bass response is an
end in itself. I'm thinking of the cars with the monster, reverbbing
bass notes booming incessantly. The "natural" sound of the old
acoustic suspension folks appears to be a thing of the past.

I think it's IF images.
3215-455=2760
2760-455=3215

There should have been something at 2760 but I have observed this image
pattern before and I haven't thought out why the first -455 doesn't
appear.

I don't think the baby has been born yet but it would automatically be
a US citizen if born on US soil. That seems to be a useful thing to do.
Art has kept his condo in Manila and is leaving his expensive ham gear
there.
The Chinese have a custom about marriage ages.

Divide the man's age by two.
Add 7 years
That would be an ideal age for a wife.

This doesn't allow for "trophy wives" but seems to be quite reasonable.

I am always amused by the way that Art Bell acts as a kind of Rorshach
test where, without any evidence, all sorts of projections come forth,
telling more about the writer than about Art.

Gentlemen, rev your engines.....Let the games continue!

- - -IF- The Radio's AM & FM {Tuning} Reception is A-OK
- - and only the Sound is an Issue - Try a set of Powered
- - {Computer} Speakers. Use the "Record Out" Jack
- - -Note- This is a Fixed Line Level Stereo Output.

- Why not use the headphone out?

David - Now that is using your Head {Phones that is} ~ RHF

The way I suggested uses the Radio as the Center Mini-Woofer
with it's separate Volume Control {Loudness} -and- the Pair of
Satellite Speakers as the Left-and-Right Stereo Channels.
Results in the Audio Output being Three Channels [2:1]

=IF= As you have suggested the Headphone Jack is used for
the Sound Output to the Powered {Computer} Speakers :
1 - The Tivoli Model One Radio's very good quality Speaker
with it's Ported Bass is out of the circuit and lost - a waste imho.
2 - The Pair of Satellite Speakers are then controled by the
Radio's Volume Control and their own Volume and Tone Controls
Two Sets of Controls -and- imho two confussing.
3 - Audio Output is Only Two Channels [2:0]

and that's the way i hear it ~ RHF
.

I occasionally monitor 75 meters with the 1103 & just the whip. This while I'm in QSO, with my Yaesu FT102 which is fed into a 75 meter doublet @ 50 feet. The Degen works fine. I can usually hear everyone in the QSO.

This little Chinese portable is an amazing radio for the $'s. Maybe the best radio per $ I have ever owned (note I say best per $, not best overall which it certianly is not) which is saying quite a bit. Better, IMHO, than the YB400 Yachtboy.

I've been a ham since 1959 & have had maybe 50 top-line receivers over those nearly 50 years including Drake 2B, R4C, R4A, National HRO-50 & HRO-60, Hammarlund SP200 Super Pro, R390A (Motorola), National NC-303, Hammarlund HQ-160, Hallicrafters SX101, SX 115, SX 122, SX 100, Collins 75A-3, Collins KWM-2, Swan 102BX, RCA AR-88, Atlas 210, + numerous Yaseu, & Kenwood.

I hear several AM stations broadcast music most of the time. Two of them
are right in town. The "Boomer" on 1450 is one of them. Those are the
english stations and then there are several mexican stations that are
also music broadcasters.

Couldn't tell you anything about C quam.

OK you convinced me. I'm going to buy one and put it next to the R75 as
a backup radio room doorstop.

If you're trying to incite a disagreement with your anti-Chinese radio comments, you're outta luck with me.

Go back to bed and make love to your R75.

Buzzing noises that are louder at lower frequencies are indicative of switching pulse noise. These square pulses are rich in higher harmonic frequencies. The power of these harmonics drops off the higher in frequency you go.

Switching power supplies, gas vapor lights starting up, light dimmers, and other items generate low frequency pulse currents.

Another thing happens in the receiver itself. When you hit the front end of a radio with these large low frequency pulses it generates very broad spectrum intermodulation products that desensitize the front end of the radio by raising the noise floor across the bands and also affecting the AGC so even when you are not tuned to a harmonic of the pulse noise it adversely affects your reception.

One way you can improve reception in a noisy location is to use a high pass filter with a corner frequency of a few hundred kilohertz.

You can see that low frequency pulse switching noise has several adverse affects on radio reception.

I have no experience using the ANC-4 of MFJ noise canceling units.

Must be some kind of image generated in your radio then. The only other USA broadcaster I hear down there is WWRB on 3185. Heard them playing Brother Stair last night on that frequency.

Another thing is I think I heard WWCR on 3210 not 3215 last night. Maybe your IF filter is wide enough to hear a strong station 5 KHz away.

Are you using an inexpensive portable radio?

Your post and the DPRK thread got me looking around these low bands last night. Reception has been very good the last few days. I was hearing stations across the Pacific, central, and south America.

I think the main problem here is that there has been so much BS posted
here by a few people in the past about the R75 and Drake R8B that I for
one turn a deaf ear to posts such as yours. The R75 is a tar'ed and
feathered radio.

The radios specifications just do not support your suppositions. That's
the way it is Michael.

A professional would not pick a Drake R8B or a ICOM 746 pro. He would
pick an RX340, one of the Watkins Johnson radios, or another make of
radio in that caliber.

4 3/8 stars from passport is far from "tarred and feathered"

> The radios specifications just do not support your suppositions. That's
> the way it is Michael.

No, that isn't the way it is. I've used both radios. I don't need a person
that is queer for Drake radios to tell me "how it is". I can understand how
upsetting and embarrassing it is to have an $1,800.00 + radio outperformed
for dx'ing and utility by a $500 radio. That is the way it is. That being
said, I could care less how many radios Icom or Drake sell. I could care
less if both companies switch to selling whole canned chickens. Give your
brain a chance. You aren't gaining anything for yourself with your

fallacious statements.

> A professional would not pick a Drake R8B or a ICOM 746 pro. He would
> pick an RX340, one of the Watkins Johnson radios, or another make of

I think I stated above that a WJ would be the choice of a pro.
Hypothetically speaking, if pro had to use a consumer radio, he'd take
something like a 746Pro over an R8 series.

Michael

Not where I'm sitting. I found your post highly amusing but then I
confess to being easily amused at times.

Basically you propose to putting the R75 audio output through an audio blender for lack of a better expression so that it sounds good.

For comparison what do I do to make my radios sound good? I connect them to a good antenna, adjust the radio controls for the station and reception conditions, and I connect a good non-amplified bookshelf speaker to the audio outputs or full range headphones for a more intimate listening experience. That's it. The radios have filters, passband tuning, tone controls, sync and the like to adjust the sound quality. I find no need for all the post audio processing you think is needed.

I get excellent sound from the Sony bookshelf speakers or the Sony headphones. No mixers, no equalizers, no amplifiers needed. All you got to do is buy a decent radio and the efficient bookshelf speaker and headphones and you are set.

Pay attention to radio specifications and the user experiences with model radios and you won't go wrong unless you pick someone with an ax to grind.

Michael,

Where are you picking the audio off of to go into your sound card?

Back in the early 70's, I was using an adapted parametric equalizer to aid
in DXing. I had it connected to the output of my R390 by Hammarlund and
output it to a low noise amplifier that had a headphone out. This allowed me
to do some very nice things on adjacent channels, like adjusting the audio
to match the desired station and not the interfering one, or to narrow the
bandwidth of the audio to make the weaker signal less covered by splatter...
or to remove lower frequency hets that added to the interference.

At that time, the only good parametrics were designed for broadcast and
sound reinforcement use, so matching levels and impedances was a big issue,
but I found that using this sort of device (the eq can amp cost more than
the R390, which I had bought new) on MW and tropical band DX made all the
difference in the world.

I'm not anti-Chinese radio. I don't make love to inanimate objects
either. I'll go to bed when I feel like it thank you very much. What a
stupid post to make.

Cheap portables have their place but they don't have similar
performance to the better equipment. You are just trying to be
argumentative. If you can't tell the difference go see a psychologist.

I can't believe the stupid posts turning into stupid threads I'm seeing here.

All my radios are digital but I don't keep a log. I'll listen again
tonight but I believe they were on 3210 as I was tuning around last
night. Since I don't care for the programming and the reception was just
one of many curiosities I came across my recollection is hazy.
